FEERRIDCYA'NOGEN is a cmmoume organic radical which has not been isolatel, but which forms with fontassium a well-known compound used in the arts, called the ferrideyanide of potassium or rel prussiate of potash. In the preparation of this salt, a solution of ferrocyanide of potassium is aeteil on liy a stream of chlorine gas until the colour of the liquid passes frum yellow to deep red, and thereafter, on evaporation and eooling, fine red erystals are olitained. The chlorine ( Cl ) acts upon two equivalents of the ferrocyanide of potassimm (twice $2 \mathrm{~K}, \mathrm{FeC}_{6} \mathrm{~N}_{3}=4 \mathrm{~K}, \mathrm{Fe}_{2} \mathrm{C}_{12} \mathrm{~N}_{6}$ ), removing one equivalent of potassimm ( $\mathbf{K}$ ), forming chloride of potassimn ( KCl ), whilst the remaining constituents combine together, and produce one equivalent of ferrideyamide of potassium ( $3 \mathrm{~K}, \mathrm{Fc}_{2} \mathrm{C}_{12} \mathrm{~N}_{6}$, or 3 K , $\mathrm{Fe}_{2}\left(\mathrm{y}_{6}\right.$, or $\left.3 \mathrm{~K}, \mathrm{Fdey}\right)$. The latter is known emmmercially in rel erystals, readily soluble in water, and yields a dine deep Prussian Hue (Turnhall's bhe) when mingled with solution of protosulphate of irou (green vitriol), and hence is used largely in dyeing and calico-printing.

FERRIER, James F., LL. D., a metaphysician, was horn in Edinburgh, November 180s. After studying at Oxforl, where he took the degree of B.A. in 1839, he was admitted to the Scottish bar in 1833. In 1842, he was electerl to the chair of Ilistory in the university of Edinhurgh, and in IS45 to that of Moral Philosophy in the university of St Andrews. Mr F. early attracted notice hy some metaphysical essays, which alpeared in Bluchuood's Magazine; and in 1554 he pullished the Institutes of Metaphysics, in which he endeavonrs to construct a system of idealism in a series of propositions, demonstrated after the maner of Luclid. He after-

J'ERIR (from Sax, form, fier. diteren, to move, promerl, allied to the lat. foro, ling. bear), a passagu by luat arross water: By the law of Dugland, a man may have a right to licep a hoat and to fury passengers for a consideration, just as lue may have is right to hodil a fair, ither ly royal grant, of ley prescription, from which a royal grant at sumb jrevious time will be presumed. Nu other title, unless conferred by act of partianent, will suffice, for no fair, market, or forry can be set 11p withont licence from the crown cither actand or presmmed. The possessor of such a title meal not necessarily be the proprietor of the soil on whed the market is held, or of the water over which the right of ferry is exercised. In the latter casce, he ned not he the proprietor of the soil win wither sile of the river, though he must possess such riehts over it as will emable him to embark and aliswmbirk his bussengers. As fullilling his part of the hargan with the publice the owner of a ferry is bouml to keep a boat lit for the purpose of carrying bassencers, whilst on the other hand he has ar right of action wot unly against those whar refuse or
 andinst those who disturh his franchiso ley setting [] a new ferry so near as to diminish his enstom.Stophon, i. lep. (itis, Gita. It has heren more than oner deeved, that the erection of a seemed ferry in such viremmetanees is a nuisince to the chnore of the uhl um, who is lwimit to keep his fory in realiuses for the use of the ducen's subjecto, a burien whidh is mot shared hy his rival (North amd sonth
 rude in Sontiad as to rival ferries is the sante; but a Lrant of ferry from the crown to one heritor does nut present his meighbours from kenping private Inats for tha transport of themsures and their fimilies and servants. Where forries have not heen given out liy royal gift, either express or presumed
as above described, they are inter rogaliu, i. e., they belong to the crown for the public benetit. In this case. they are nodur the management of the trustees of the roals connected with them, or are rerulated by the justices of the peace for the county, or by special acts of parliament. Dy 8 and ! Vict. c. 4l, certan rales are laid down for the regulation of ferrics. Tha act is continal to sootlaml.

Common rowing-hats are generally usel for ferrying font-gnssengers, hat when horses and carriages have to le taken wernss, a flat-buttomed large, with an inclinel plane at rome emb, to rest uent the shore, for lanting and embarking, is gemerally usel. This is either rowed across ur fulled by a row. When the currat is strums. and the river of momerate wielth, the liatter is lust. The rope streteleal acronz the river passes themuh rings or over pulleys attached to tho barge and the ferymen move the barge across hy pulline the rope The ehicef alrantane of the rone is to restrain the bage from drifting in the direction of the stream. Witl a small lwat, this is obviated by the ferryman rowing ollifucly, as though were stecriag for a point higher njr the river ; than he moves throngh the water mipards to the same extent that the water mowes over the lam downwarls: and hy a composition of there motions, and his tenting to the wther side, lee is carried direetly across. Frode extumios are how traversed in many flaces loy stean-ferry:

Rafts are sonnetimes used for forrying On the Nile, a sort of raft is mate of inverted earthen-pots full of air. Fior further information on the eressing of rivers, see Furm and Fohbint.

Fhling-lothly is the name given to as kind of forry-boat which is movel across a river ly the action of the combined forces of the stream and the resistance of a long rope or chaim made fast to a fixed broy in the middle of the river. The lomat thus attrehed is made to take an oblique position by means of the rudder; the stream then acting against the side, temds to move it in a direction at right angles to its length, while the rope exerts a force in the direction towards the buys. If these two forces be represented loy the siles of a parallelogram, the artual course of the boat would be in the direction of the diagonal (see Composition and Resolttion of Fohees) : but as the lageth of the rope remains the same, the bat must contimue always at the same distance from the lmog, and therefore its course is a curve, a $p^{n o r t i o n ~ o f ~ a ~ a r c l e, ~ o f ~ w h i c h ~ t h e ~ b u y y ~ i s ~ t h e ~ c e n t r a, ~}$ aul the rope the rallus. The enurse of the boat and the action of the two forces are strictly analegous to the $\mathrm{m}^{\text {ath }}$ of a rising kite, amt to the forees of which this path is the resultant. The holder of the kite eorresfonds to the bung, the wind to the tidal stream, and the tail to the rubler. Flyinebridges are used for military phrposes, and the modes of alapting them to the varying ciremstances of the wilth of rivers an! the relocity of their eurrents, forms a part of the stuly of military engineering. An impurtant cement in the problem, is the determination of the right point of attachment for the rolue. In the casc of a wide river, the rope oldain remuires to be of eonsiderable length, and must le euperten by movable buge of by small beats.

## FERTILISATION OF PLANTA. See FecunDation.

FESA, or FASA, a town of Persia, in the province of Fars, $S 0$ miles south-east of Shiraz, is situated in a mountain defile, is of considerable size, and is said to have a population of 18,000 . It has manufaetures of silken, woollen, and cotton fabries, and
some trade in a superior kimd of tobacco which is grown in the vicinity.

FESCENNINE VERSES, a branch of the indigenens joetry of anciont italy, were a sort of dialogues in rule extemprove versces, generally in Satumian moasure, in which the parties rallinal and ridicnled one another. It formed a farourite mumsement of the cometry-pwhle on frotive ocrasions, especially at the emblusion rif harvest and at Weddings. As was to be capectenh, it uften deume. rated into licentionsmes, that at last ropuirea the curb of the law. The Festomime visoss are usnally considereal to be of Etruscan wrigin, and to have derived their name from the Etrurian town leseme mimm but there is little probability in this etymohng. Verses of this surt were and are pepular to this day all wee Italy'. 'The name is more likely comectell with faseinm, fascinatmo, enchantment, or the evil we, aganst which the chanting of versps may have oricimally becon intemetel as a motaction.

FEsTMCL心, or FLSSTS (Lat, fistum, brolally from the same ront an fost ( $1 . \times$ ) ; acemrlige to same, from (ir, hestit, hearth), is tom denoting cortans perinlically reenring days amb seasmas net ashle by is commmity for rest from the mdinary lathon of dife, ant more or less hathowed by rdigious somemnities. Origimatine within the narrow circle of the family, ant emmemuration momentons erents affectind one mouher or all, these panses beame more frepuent, and of wiler seope, as the house gradually expankd ints is tribe, ic penphe a state. The real or imaginary fommers, legislators, heroes, beeame oligects of rommation and (cilieation, and the salient romels of their lives the consecrated epochs of the year. Niational calamitis ur trimmples were, in the absuce of amals, hest remembered ly corresponding gnn ral days of hamilation or cxultation. Earliest if all, however, dil the makien stages in the onward march of nature: sprins and antuma, sted time and harrest-time-symbols of life and deatly; the sol-stices-turning lunints of summer and winter; the new monn an! the full nown; the termination of rycles of moons abd eyeles of years, present themsidves as "plportune halting plates for man himself. Xor less were the all-important perientical rises of fortilising rivers, and the anmersarics of inportatims and inventions of new implements for the Ineter cultivation of the soil, or temping of the dheress, lndittingly edelrated. The isherent haman tendency tuwards roferring all things of whater inport, life and Neath, athmenace and want, victory and defoat, fo a higher power, conld not hat infuse a religions fintiner into cporlis so marked. Fostered and gutibed log priests and lawivers, this property of our nature aremor fomm its expression in common satrifees, [4ayers, ath] ecromonies, comseratal to the varions
 bablital the elements of the visible and invisible cration, and who, working all the changes within thom, atell, each in his sphere as a partial proviInmo wrom man. Accordine to the event which rallent them forth, these festivals were mournful or juyns, jubiliant ur explatory: Even when sorrow wis to be expressen, the martitication of the body dial not always sutfice, hat plays, songs, dances, ant frocessinns bull uf hoisterous mirth. wre resorted th-as in the festivals of 1 sis at l'usiris, of Mara at l'apmemis, in the Alonia of Lyght, Phenicia, and Greep:- becanse the divine wath or sorrow was, like that of man, to be changel into satisfaction. besiles the ralation between the common tutclary doity anl those he protected, the boud also by which the otherwise disconnected members of the bunly fulitic were held together was, by means of these festive gatherings, periodieally hrourght in viow, ame invested with greater strondh and impitaner. Apart, however, from this their histhrical, astronomical, religions, and joblitica! eml, fintivals served another purpose-that of growing - ivilisation. It was the glowing spirit of emulation which, stimulating the gifted in mind and becely to strive for the festive lavel in contests of penius and skill, in honome of the gols, and in the face of all the perple, matured all that was moble amb hriliant withon the community. Arehaic ruleness and rustic extravayme became refined grace and classic harmony. The stirring lrama, the forions anthem, the indoclious dance, the elegant game, which wempaniol the festive sacrilice of some nations at their highest stage of development, hat arisen out of those very mimicries and shouts, rudo
and savage beyond expression, of renerations not long before them. Enthusiastie, widd, metaphysical bingt invested the comntless lays consecrated to hor ileified stars, plants, animals, and ileas; to the Nile, to Immon, Iiteph, Menes, Osiris; to JForms, to Neitha, to Itah, with a mystery, sensuality, and mourufulness always exaggerator?, sometimes monstrous. The lIindu, no longer dariag to wite human sacrifices, shews his otld and crucl materialism by throwing into the waves, on his festival of rivers, some of his costliest roods, gald, jewels, firments, and instruments ; while in the licentiousness and debancheries perpetratet on the festival of Shisou, the corl of procreation, or on the Pacchantics of the goddess Bhavani, he exceeds even those of the Egyptians on their Neitha feasts at Bulastis, and the Greck worship of Vemus in her Cyprian groves. Phnoniciaus and Assyrians, Babylonians and Pbrygiaus, according to the little we know of their religions and manners, appear to have feasted, thanked, propitiated, mourned all at diflerent times, and in the way most befitting their several natmres, even in the case of those gods and festivals which they hat in common.

The ancient Persians alone of all nations harl wo fostivals, as they had no temples and no common worship. These 'Puritans of Polytheism,' who worshipped the sum only, and his representative on carth, fire, sonmel show and jomp, and large religious ratherins. A striking contrast to them is formed, in another hemisphere, by the ancient Mexicans, who were fouml to possess one of the most richly developed calentars of festivals, seien. tifically divided into novable and immovable feasts. As a strange and simgular fihenomenon amones festivals, we may also mention here that 'of the Dead or Sonls,' celebrated among the wild tribes of North America. At a certain time, all the graves are emptied, and the remains of the bodies huried since the last festival are taken out loy the relatives, and thrown together into a large common mound, amid great rejoicings and solemnities, to which all the neighbouring tribes are insited.

Grece harl received the types of civilisation, religion, and art from Exypt and the Last generally, but she developed them ill in a manner befitting her glorions elime and the joyons genius of her sons. At the time of the Iliad, two principal festivals only-the harvest and the vintarge-stem to have been celebrated (ix. 250 ); but they incrasel with such rapility, that in the days of Pericles they had reached the mumber of a thousand; some indeed being an repitome only of their memorable feats of arms, others restricted to one town, or province, or lrofession, or sex, or to a few initiated, or recurcing only at intervals of scveral years; but there were still so many kept by the whole peoulc, that ancient writers bitterly denonnce them as merry leegimings of a sarl end, as the slow but sure ruin of the commonwealth. Their foreborlings provet true enourh; and yet Greece would certainly never have reached the highest place among nations, as far as literature, the arts, and philosophy are concerned, hal it not been for the constant enntests attached to her many festivals. She resisted Asia, hecause ler citizens were always alert, always realy. The religions part of the festival-homage offered to personified i.leas-consisterl mostly in the carrying about of the deity of the diy to the sound of tlute, lyre, and hynns, aul in a sacrifice, followed by a general neal huon certain portions of the animal offered. Then followal scenic representations symbolising the decds of the gods; after which came games and matches of all linds-foot, horse, and chariot races, leaping, buxing, throwing, wrestling, \&c. Separate
accounts are siveu of some of the more remarkalle Grcek festivals. Sce linccines, Eletsinian Mrstenies, Paxathexala, de. There were also speciad times set aside for the 'IHIy Gannes' proper. 'The most important of these wire the olympian, the Pythian, the Nemean, ami the Isthmian. (See these heads.) As all these festivitios were provinled out of the public purse-from the contiscaterl estates of the "tyrants' and political delimpuents-the individual diel not suffer more than a welcome interrultion of his usual husiuess, ant unter that rouial sky tho penalty to be paitl for occasional iudolence was unt tuo heary.

Rome, founder amid pastoral fostivities in honomr of some god Pales, adopited and acclimatisnd, as she went on from conquest to comquest, the formin deities, exactly as, with her usual prudence and practical sense, she conferred her right of citizonship on her foreign inhalitants, and on whole nations subjected to her rule. Her yoke was thus less galling to the now provinces, while at the same time the jopudace at home found snffeient bistraction in the many ancient and newly imported festivals, with their quaint rites and croreous paceantry. Set the liomans-more parsimomions and abstract hy nature than the vivacions Greck neighbours from whom they had accoped the greatest part of their religion-never execeded in their festivals the number of one humblred, and in these, again, a distinct line was drawn between ciril anil religious ones. Some of the principal religions iestivals were the Sementina, on the ezth of January -the rual festival of the seed-tine; the Lupereatia, in homour of I'an; the Cerealia; the night festival of the Bona Dea; Matmoalia; Ninervalia; \&c. "In the purely eivil ones belong the Janalia, the lst of January and the new-year's day, when the new consuls entered upon their office, anil friends used to send presents (strenm) to each other: the Quirinalia, in memory of liomulus, aleificd unter the name of Quirinus: and the satmalia, in remembrance of the golden age of Sintum, bemining on the 19 th of December. The celelration of these festivals was in all respects imitated from the firecks, with this lifference only, that the games conmecten with them hecame, with the pre-eminently luthionse Fomans, terribly lifelike inages of war. Their sham seafights; their pitched battles hetween horse and foot, between wild beasts and men; their so-called Trojan cames, exeented hy the flower of the nobility; their boxincr-matclses (with gloves that had lead and iron sewed into them): circus, arena, and amphitheatre gave, especially in later times, the greater satisfaction the greater the mumber of vietims.

It is one thing only that monotheism has in common with polytheism with respect to its festi-vals-namely, that they are with each the religious exuression of human joy or human sorrow. Lut if the fommer, with a dim misgiving of some awful and supreme power, invited the multifarious governors of the many provinces of nature to partake, as guests, of bodily and intellectual feasts, togrther with their hosts; monotheism, in bincling up all fear and all hope, all gratitutle and all awe, which moved the heart of man, in one almighty Creator, Mover, and Maintainer of all things, eelebratel its festivals in honour of this onmipresent Synit with a veneration, a purity, and a lofty elevation, such as the worshippers of star, animal, or imace never knew. With the first anl strictest monotheists, the Hebrews, whose very existence as a nation was traced to the special and miraculous interference of this highest and only God, the remembrance of that great event, their liberation from Egypt, and the momentous period of preparation in the desert which followed it, mingled with almost all their religious

St Muk'o Library, Venice.
flowers with which the heals of the animals, the altars. de., used to be decorated. The fustorn occurs along with bulls hearts on the frieze of the temple of Vesta at Tivoli. The fige is an example uf a renaissanee festoon, from the liloray of St Mark at Venice.

FE'STUS, Rexres Pompfics, a Latin lexienfrapher, of the third or fourth c. of our era, is ome of the most important anclent authorities we have on the Latin language. He made an epitome of the great work of Verrius Flaceus, Ie Verborem Signifientione. This compilation, which was arranged alplabetically in -0 buoks, was still further abridged and spailel in the emb of the sth c. by lanl. son of Warnefred, commonly called l'anhs I liaconus. The great worle of Flacens has unfutumately entirely perishel, and of the aluribgnent made liv Festus, unly a single Dls., amp that in a thelurably inmerfect condition, has survirel. It came from 311 yria. and fell into the hands of Pomponius Lactus, a distinguisherl scholar of the listh century. It ultimately passen into the lilorary of 'arblinal Farnese, at larma, amp is now preservel at Naples. The work, in spite of all its imperfections, is a gram stomenose
 antiquities. All previms editions of F are of little ralue compared with that of K. O. Minler (Giott. 1839), in which he has made nsice of the Farness MI and other sources, distinguishing the vahue of each.

FETICIISM is the worship of a fetich. The word fetich comes to us from the Portugnese, who Were the first Europeans that trakel on the west coast of Africa, aurl who expressent their itca of the religion of the natives ly the lortugucse worl fitiono, "magic.' This word, somewhat modiffed, passed into the Freach languare, throngh Brosse's treatise, Du Culle des Dieux Fétiches (Dijon, FiGu),

Hud from him into Gicman, through the metion of listorius (Stralsume, 1-55). The term has now reccived laropean recognition. A fetich is anythime in nature or art to which a madical power is ascribel, e. g., stones, carved tigures, or certain parts of plants, amimals, de. In this gen ral sense fetichism coinchles with the belief in charms-a helief which is also to be frome amone monotherstic nations. The tirst st ' 1 out of fitichism, is when igmorant tribes cease to be satisticel with believing merely in the mancal power inhornt in their fetiches, and hegin to ascribe a cortain conscions (oneration to the oljocts of their reverence, espocially to the fetiches in the forms of leasts or men. In this way the fetich lecomes an idol, and fetichism an dolatry. The lowest form of such idelatry is wh re the suage does not hesitate to throw away, to thastise, or even to destroy his futich, if it anes mot apmar to gratify his desires. The reverence for sumblums, montains, streams. \&c., which formed bart of the religion of the oht Grecks, Telts, and Cicmans, is met fetichisme mer, but rather belougs to the worship of nature.

FETID LIMECTONE, a yaricty of limestone which sives sut, on heing viobently rubbed, or struck with a hammer, a smell like that of sulpharetted hydrozen gas. It has a lark eofour, prodiced
 animals whese hand treletons eompore the rock. This animal matter may perhaps alsu le the cause of the disargeable smell. Stinkstone or swinestrue have been hlewise employed as characteristic names for this limestome.

FETLOCK, or FETTERLOCR. English heraldic writers speak of a horse fetlock or fetterlack, and rejresent it thus. It seems tu have luen an instroment fixed wo the leg oi a horse when put to pasture, for the purpuse of preventing him from rnaning ofl. In scotch llerahby, a hoor is nsually substituted for the chain, and the fetlock is represented this, as in the arms of Lokkert (Lockhart) of bame, givin hy Sir Daval Lindsay : Argent. on a lemi sable three fetterlocks or. some branches of this
 fanily carry a man's heart within the fetterlock. me if the heals if it hating accomfanicy Troml Sir Janes Douglas with King liwhert the Bruce's heart to Jerusalem (Nishet, i. 1. 320).

FEU ANi FET-DUTY. A fen may be described, in familiar language, as a ritht to the nse and cojoyment of lamds, buses, or wher leritalle subjects, in lexpetnity, in consideration of an annal payment in grain or mones, called feteluty, and certais other contingent burlens callad casuaities of superiority (see Cuscalti). Thoun a fen was fremently nsed to experss any kind of tumure ly which the relation of sumerior and vassal was constituted, in its nar. rower meaning. which we have here impleated, amb which is that in which it is now almost exclusively usel, it Was opprosed, on the me hand, to those temures in which the return consisted of military or wher persomal scrvice (wad and the like), and on the nther, to those in which the return was illusory (blanch), the only ehject of which was to preserve the relation of sulicrior and vassal. A fen, in short, was a lerpertual lease-a fen-farm, as it was often called- la which the temant lrecane hound to pay a sulistantial consileration, ant his rights under which he mitht forfeit, as the fonalty of non-payment. In the present day, the disposal of land in fon is pactically a sale for a stipulated ammal payment, equivalent to chief rent. It is in this light, accordingly, that feus are generally regarded in

Sontland: ambas it is un this fontine that alumst all
 property th helo. they form an important elament in the iraprictury reations of the comter: The
 to have sereral atsantines wer that of the lome bubinashoses common in Enchand. From its per
 fussecanal a beelay if greater interst in the proderty and wandly leals him to erect more emblume structures that lie peobably wombl thenter at Lowe. Fior as time runs an, the bou witen incrases in valuce whale the reverse mast always the the ease with heschould propurty. Neither ihnes it in any deare interio re wath the lotime wi moperty on lease or "therwise Almont all the houses in Elinhurgh and the other tuwn in soothand wheh are let. cithee on lases or irom year to year, are

 duthes are in cencral patid in mony. When the stpulation is fur a duty in grain, the puantity is
 padia innoy acombints: the leed transferrine the land in fon from the superine to the vassal is callecl a fen-darter a chansily conceived amel expensive devment, whid reguires renewal in the case if heirs to rassals, of of purtios to whom the vasoll sells his right: and thes repetition of the trameaction, designated as cutering with the supering." furms the heary drawbat on the acquisition of lam in $\mathrm{f} \mathbf{\mathrm { n }}$, no matter how small in amount. Csually, the fon-charter reserves to the saperion all minerals in the grouml. and stipulates that the vassol shanl houh his homse eqther in a particular style or of a eartan value. By the Neuttich stat. 1507 c. adt, it is declared that all vassals by fen-farm failing to ge their fen-duty for two yars the ether, shall luse their riuth in the same mamer as if an irritant chase har lnen shecially engrossed in their charter. $\quad$ bint as the superior must olitain a decree Aeclaring the lass of the sacsil's right, lefore the forfeiture can take etfect, it the fon is worth keepins, the dutior, as a mafter of consse, will he paik. In the very rare case of the property having fatlen of in value to the extent of rembering the fen a pesitive humben, it is possible that the irritancy many le vinntarily incurred. Fon the most part, land proprictors near towns and manfacturing vilbece are andints to add to their ammal rental by fening ramels for hathing guroses. The rate of fonl is rery varims, from as low an as to as high as atoll per acre per annum; a common rate is
 it is payable be the fenar-mot the tenant to whom the foliar mas have let the property. When a luilling constets of several thors forming distinct dwellings, the feu-duty is :alleaterl in erean proprontions amone the respective propretors the fenar to whom the lower thour helongs usially manes most. In propertics of this kind, each is responsible only for his own share Geasionally. fedr-duties are noferel for sale; and as a sate investement, hring from en to : 30 years purchase. In sthen cares, the waschl has an "phertunty of extimenishing his ferlal tomure and heomine the supher. There are alsw instances of vassibls suhbenine. It is customary in feming hailing lames for the superion to make the rouls and drains. Relieved of this obligation, and wotting jussession of a site on a mur prospective anmal payment of perhaps only a few shillines, the fenar has an modoulted alvantice: lowking, bwerer. to the emmbrameness and onst wi the fea-charters, ant the lialitity of successoms to pay fines at entry, the system is entanded, tronthome, and expensive; and, at least as far as
forms are conecract, is allowed to stand in need of retorm.
 another furm of the word fight, and is allied tor fer, aml probably to githel. It meant a war walged ly no family of small tribe on anotler, to avenge the alath ur other injury of one of its mombers. In a certam state of suciety, this is a legitimate mode of whtaming retress. It puevaded extensively anong the nations of Northern Europe ; and it was ouly by uradual steps that the mactice nas first restricted and then alwished. The liws of liadolf I. of (iermany recognised the right of waring feuds. At last, partial associations were formed, the members of which homal themsclves mutually to settle their difterences ley couts oi arbitration and compensatim, withont ernes to war.

FELDAL SYSTEM. By snme, the word feu or fouk of which fendal is the adjective, is derived from the Lat. fides, faith, and and or odh, or od, a Tentonic worl signifyine a property, or estate, in land; whist ly others. with perhats weater probability, the inst sylahle also is mantained to be Teutonic, enuivalent to wich, eattle, ultimately from the same root with the Latin pects, which, in the from of pecmia, came to signify property, and its represcatative, moner-because, as Varro remarks, Luperty amonst pastoral mations consisted of cattle (Vars. Me I.inga Latine, 5, 19, s. 95, cd. Miill). A feudum, in this sense, would be a piece of land heh fur a fie or peeuniary consideration, using pecmaiary in the wide sense which its etymology suggests. The this as it may, the feudal system, as a develnem institution, belonged neither to the Tentonie no to the Romanic nations, in their original and mmixal condition. We find it neither in tho wools of Cicrmany, nor in the Roman empire previons tu the incursions of the Franks and Lombards. Neither the institutions deseribed by Tacitus, nor those with which the Roman jurists have rendered us familiar, exhibit anything that is cren analogous to it as a whole. But they each exhibit partial indications of some of the characteristics which most pecnliarly distinguish it ; and as it arose about the begiming of the 9th e., just when the fusion between the conquering barbarians and the snbject popuations of the Romanised provinces was everywhere taking place. it seems impossible to doubt that it was a result of the mutual intluence of the two races. The subordination of class to elass, and the intmate relations by which all the classes of the commmity wore bound tugether, taken along with the ind pemence and equality of the individual members of each class within itself, were amongst the most prominent features of the simple society of the Tentonic nations: and these correspond with wonderful acenacy to the relations of superior and vassal, beginmin! with the sovereign and descending to the smallest feudal proprictor, and also with the equality amongst peers, which existed within each of the feudal classes. On the other hand, the incomplate and fiduciary character of the proprictorship implied in a fou, as held in trust from a superior on the faith of services to be remilered, or dues to he pail. bore a very close amalogy to the Roman cmphytensis (from which inded the word feu has oft:n leen derived), and to the dominium utile as "punsul to the domiaium directum. See Dommina and Expurtecsis.

The mature of this very important social instituthon. by which the life of cvery European poople of any importance was governed from the beginning of the !th till the close of the 13 th c., and by which many of the forms of our modern life are still effected, will probably be more clearly understood

FEUDAL SYSTEM.
if we commence our deseription of it from below. by exhibiting the prsition of the simple landholder, than by alopiting the monareh in whom it culminatel, and from whom, in a technical sense, it was supposel to flow (see Allonitm), as our point of departure. The latter course has heen more strictly adhered to by English writers, from the circumstance that, sulsequent to the Conquest, the whole territory of Englaud was resarded as the property of the eonqueror, and was by him divided amonest his barons, and by them amongst their dependents, an arrangement which was somewhat peculiar to England (see Allodmal), whereas the feutal system, in its essentials, was common to the whole of Europe. A feudal proprietur, then, or fend atory, was a person who hell his lands from another, for his own lifetinue merely, in the earlitr times, on condition of certain services which he was to perforn to a superior or suzerain. Apart from the cluties to which he was thus bound, he was uot ouly a free man, but his position was that almost of an intlependent sovereign within his own sumall dominions. If his holding was at all an extensive rine, he liverd in a castle, which, notwithstanding the efforts of Charlemagne and his successors to prevent it, was generally fortitiel, not only for purposes of defenee, but to enable hims to jursue that life of rapme which in lawless times was not considererl inconsistent with homesty or lersonal worth. Forgreater security, the castle was generally situated on a height, and under its walls there nestled a village, in whelh all the itepemdents of the proprictor, with the exception of his inmediate family, and all those who lived by the cultivation of the soil, usually dwelt -isolated farmuouses and cottages being too mucl2 exposed to plander to admit of their leeing scattered over the county then, as we see them in England now. A prortion of the inhabitants of each feudal donain were usually hound to the soil, and were thus subject to a species of slavery, the conditions of which varied according to the custums of different districts. These were spoen of as adscripti or adscriptitii gl-lae, and were called nativi, or bondmen, and villein-socmen, as oprosed to free-socmen on the one hand, and serfis or theoures on the other, of whose position we shall speak below. (Stepheu's Com. i. 1. 18S.) 'He was,' says Sir Franeis Palgrave, speaking of the ceorl, ' a villain appurtenant; and, notwithstanding the language which was employerl (to the effect, namely, that he could be leequeathed, bought, and sold), it must be understonl that the gift, the beguest, or the sale, was in effect the dispwition of the land and of the ceorl, and of the services which the ceorl , $u$ erformed for the land, a transaction widely differing from the transfer of a slave, whose person is the subject of the purchase.' (Rise and Progress of the Enylish Commomeath, vol. i. 1. 18.) The ceorl, moreover, could purchase his own freedum and that of his wife and ofespring (Ib.). See Villein. The rest were free tenants, farmers in the molern sense, though lersonal services to the moprietor probably in alunst every case constitutel a portion of the rent which was paid. Latterly, when the system of subinfeulation was introduced, many of his wealthier tenants came to stant to the baron, or lord of the domain, very much is the relation which we are about to clescribe as subsisting between him and his lord jaramount. From being tenants-at-will, scareely less suliject to his authority and exp"sed to his caprices than the thralls, or rilleins of the lowest class, they became vassals of their lord, and free eitizens of what thus gradually developed itself into a feudal monarchy in miniature. The tenure by which this latter class held their lands was generally kuown in England
as Free Socare (Stephen's ut sup. i. 205 et sef.). The castles by which the banks of the lihine are studded along its whole course, from Bonn to Bingen, with their villages and parish ehurches, for the most jart in the condition in which they were erected centuries ase, afford the most numerous and perfect examples of the arrangements of the feudal periol which are perhaps anywhere to l,e met with. The possessors of these castles stood in a magisterial as well as a propritary relation to their dependents. They exercised juristiction, extendiug even to the inthetion of capital jumishmeat, either in person or by mans of afficers whom they aprointed for the prowse ; and the castle was in geural furvished with dungeons and other appliances for carrying their sentences jnt execution. Towards each other they stoot in the relation of equals, or peers (Lat. porcs); they were neighbours, simily, and frieuts or cnemies as the case might be-too often the latter. But towards their immediate fental superise, the connt, marquis, duke, or whatever might loe lis title, to whom the government of the whole district belouged, they all stood in a relation which brought them in contact, and in some slesree bound them to each other. Of him they held their lands on cenditions somewhat sinular to those on which they let them out to their own dependents. At tirst, as we have said, they were only tenants for life; lut their rights in innst countries very early assumed a hereditary character, the cominant imonietor's rights, on the death of a tenant, being contined to the exaction of certain dues from lis sun and sucetssor, as a consideration for conferring on him, or rather for contirming to him, the feu which his father hal held. Where the fen, tief or feoti, as it was sontetimes called from the mote of aumission -feoffment, or, as it is saiel in sootland, infeftment ( $(1 . v$.$) -descencled to a female, the tominant$ proprietor was entitled to control her marriage, for the purpose of procuring himself a sufficient and trustworthy vassal ; a privilege which, bike all those of the lorl, was latterly converted imto a mere pecuniary claim. When the lord paramount, or suzerain, as lie was called, helil his court of justice, his vassal harons were the judges, being all on a footing of equality. or parcs curie, as it was called. When he made war, ather on his own account, or as furnishing a contingent to the army of the state, in such cases as in the wational wars between France and England in the 12th aud 13th centuries-which were the earliest instances of really national wars-his vassals were lownd to attend lim in person, and to furnish each the contribution of wen, horses, arms, and other materials of war for which he was liable by the temure on which be beld his lands. In adalition to these services, he was bound to watch and ward his castle, a luty whieh the minor barons almost invariably imposed on their rassals when the system of granting fens extended downwards to the class of inersons who hal formerly been were tenauts-atwill. Then there were certain dues which were almost always exigible from the vassal, such, c.g., as contributions towards Iroviding a ransom for his lord when in captivity, for enabling him to celebrate the marriage of his ellest son with due pomp, or to provide a suitable dowry for his daughter. If these dues were not paid, the linnl reverted to the dominant proprietor, in relation to whow the rassal all along was a mere nsufructuary. Su far were the conditions of feudal holdings from beiag always the same, that no less than eighty different teuures have heen enumeratel; the onorous character of which varied from what was merely nominal, c. g., the payment of a white rose or a

latiorion in all the chisess of somidy in fumbel

 vo, one if the mant distinguishel criminal furists
 Fromeht ip at branfiuten-the-Maine, where his father was an adrueate, am enlucaterl in the grmansimm there, he went in $17 \mathrm{~S}_{2}$ to , Tena, where he cultivated his mind by the stury of philosuphy and then d wotel himself tionsitive haw. In 170 h he apeared as criminal jurist in a work (In the (rime of Minh Toresen, and in the foblowing year he began to deliver lectures in the miversity of lena. In his lectures ant publishod writings, low introduced into crimimal jurispuldoce on new methon of treatment, which was systematised in his Cimpunlimm of tierman I'emal Latw (Lohrtuch dos fremeinen, in Deutsch.
 14 Anfl. bum Mittımain. 1840). This celebrateel work placed F . at the hat of a new schom of jurists, who manatain that the cheision of the juipe in every case nught to lue tetemmed solely by an express deliverance of the penal law, never hy his own tiscretiom, and who in that account witaincel the name if liugrists. In Ins)] F. was ajpminted ordinary professor in Jenit, hat in 1 soz acectath a call to Kiel. In I804 he was remesel to the miversity of Landshut; lut next yrar, having received a commission to prepare a 1 man colle for bavaria, he was transforred to Alamela as privy referemary for the minis. terial, jurlowal, am pulice repartments; and in 1808 was apmintel piry-crmandlor. The new penal mode which he plamed for Pavaria (Strofoeset-luch fïurdus Kiniancinh Buim, Manchen, 1818), receivel, ation a few mandieations, the rogal arpowal, and was taken as at hasis in the ementation of the crimimal law of several other conntrics. During this perime also, be pmbinhed his Remarkable Cases in
 1;1e., Giessen, 1 Sos-1811), which first led the way to a deeprer prsychologieal treatment of such eases. In 1812, he pimbishent and on 'lrial ly Jury, to which a secimel whame, on the durdial Irocedare of France, was aldoul in 152\%, is the restalt of a visit to l'aris in 1sel. In 1517 he lreame second prosident of tha Conut of Apral in Bamberge, amb aftorwarts first presilent of the Conrt of Appeal at inspach for the liwat dintrict. In 1832 he pmlinhal a work on the nufortunate kaspar Hanser, whise mystrions fate haw strmgly attraeted his interest. He had just enlital a crillection of his misecllanerns writines, whon he died at Frankfurt"in the Man orith May 1s33. An interesting life of F. has hach written by his son, Lulwig (Leben
 14in). F. luft, lesides three daughters, tive sons, who have all distinguisbed themselves in German literature.

## FEUERBACH-FEVER.

FEUERI:ACH, LtmWIG ANineAs, German philosoplier, fourth son of the preceling, was forn at Auspach, 2Sth July 1804. Aiter studyiner theology
 in 1SO4 he was attracten to berlin for the purposis of liearing llegel, and soon after he abomoned thenlory, with the view of devoting himself entirely to philusonhy. In lsos lue beame primothome in the university of Erlaneren, lout in a fow yars 'uitted the aealemical char, and give itjo his whole time to literary labour. In a small anomynums
 berer, 1s 80 ), which attracted little attention when it apearel, he imbicated that he had alrowly gone leyomi thee standpuint of his master 1lourel, liy eomabating the dortrime of immortality. I mirine the next few years, he pulnished three works on $]^{\text {wortions }}$ of the history of plilosophy, treating severally of the prexiol between Bitern and spimoza, of Leilmitz and of lierre Payle. Bint these histmieal works only paver the way to a critical investigation into the nature of religion and its relation to philosnjhy, the results of which have leen given to the worll in several works well known to speulative theologians. The anost celelrated of these is lis work on the Nature of Christianity (Das Wisch des rhbiven. thums, Leip. 1841; 2 Aufl. 1St3), which has lemen translated into Fneflish. Startine from the Ferrelian doetrine, that the Ahsolnte comes to eousciounness omly in lumanity, F . demes to it any existence beyond the hmonn eonseionsuess, maintaming it to be merely the luojection by man of his own inval into the oljective worhl, on which he feels his depentence. All authority ahove man, and consefuently all moral obligation, is therefore eonsistently regarded as a delusion proceeling from man himself, and the lighest good is explaned as that which is on the whole must phasuralle. let even this highest good is futher explained as consisting in rescmblance to that ideal humanity which man creates fur himself, and worships as forl. A kind of ideal theism is therefore retained ly F . ; but when his doctrines were adopted by the mass of German commmists, they nlegeneratert, perlapis logically, into an actual atheism, whelh ignored any moral or social law imposed on the individual from any other source than himself.-The works of lo. have been collected, with adolitions and corroctions to. lringe them into accordance with his later viows
 and since then he lits published a work entithed Thengmie (1857).

FHLILLANS, CuNGRENATION OF, a reform of the Cistereian orler, romarkable as formine part of the great religions mownent in the lemman Catholic Chwoch during the lothe, contempurary with and probably stimulated hy the progess of the Roformation. The author of this refom was Jean IJe la Eirriere, abbot of the (istereian monastery of Fenillans, whu, painfully struck by the relaxition of its discipline, laid down for honselif at new and much more austere course of life, in whith he soom fonnd many imitators and assuciates among the brethren of his omer. 'j'lop mule thas reformerl was, after considerable opposition from the alvocates of the old rule, aproved, with cortan monlifieations, by l'ore Sixtus V.; the refinmed congregation, however, being still left subject to the authority of the abbot of riteaux; and a convent was founden fow them liy Ilemry III. in the Ine St Ilonore, I aris. The subjection to the abbot of Citeanx was rumoved by ilement Vlll. in 1595 ; aud lrban VII, in 16.30, sepurated the congresation into two lianches, one for lrance, and the other for Italy, each moder a distinct gencral. The rules of both these branches were
subsequently momiticil alrout the midalle of the same century.

The eelelnater monlationary cluln of the Feuillants took its name frem this rumber, the emoment of which, in the line St IHonore, was the flace of mentines fore the members of the clonh. It was fummonl in 1790 by Lafayette, sieyos, Larochofoncanll, aml others habling moderate oninions. The chalows at first called the 'Company of 1789,' and was intended to support the constitution acminst the ultra party: It reckonel amons its members individuals of all classes, who took the constitution of Ensland as thuir monlel. 'This onnosition serven, hownex', muly to accelerate the revolntionary movement.
 Tomonere beiner elected president of the clubs, a popmlar insmrrection broke out against it ; amd, on tha seth March, the assemhly in the cloister was forvilly tispersed liy a raging mob.

FUU1LLETON (Fr.), Jiterally a small leaf. signilies that portion of a political newspaper set apart for intelligence of a nompholitical character, for eriticisms on art, literature, \&e, ans] usually separatel from the man sheet by a line. The feuilleton is an invention of the Jonemal des Dibats, which, since the year 1Son, has heln an important place in the sphere of literary critiesm. By fegrees, the belles.lettres element began to pervale it; and the result was a species of light joumalistic literature, in whicl Jules Janin freame the acknowledged king. In the years immediately preceding the: revolution, Feb. ISis, entire rmances were spun ont in the feailleton. The fonstitutionnel, in partiendar, mate large peomiary protits by the sucial romances of Eurene Sue, which it published in this manner. The french system las bern imitated in Englamel and Germany, though with less suceess than in Frante.

FEVF'DA, an island of Pritish Colmmbia, is situater in the Ginlf of Cremeria, letween Vanconver land ami the continent. "It is in lat. $49^{\circ} 41^{\prime} \mathrm{N}$., and lons. $124^{\circ}$ W., meastring 32 miles in length by 2 in average breadth. It possesses a snug little harlmur, which apreiss to be all the more valuable on acernat of the superior "puality of the fuel which abomels m the spot. Its formation is mulerstood to he wholly of limestone.

FEVED (Lat. filoris, from fireco. I grow warm, or ferhays from fobran, l cleanse), a form of diseaso characteriseal primenally loy increase of the temperature of the borly, which, however, requires to he estimated accorlinis to the state of the internal parts, rather than the cxternal ; the surface of the lunly, and particularly of the extremities, being not unfrequently colf rather than warm. Havins recural to the heat of the surface only, fever has emmmonly heen emasintered as passing through three distinct stages, more or less marked: 1 , the cold or shiverings stage: 2 , the hot stage; 3 , the sweating stare. This describtion is prafectly enrrect in most cases, but it requires to be qualified by the remark, that even in the culd stage of fevers, it is now well ascortaned that the hood and the intemal mgans have an elevated temporature, as estimated liy the thermometer introduced into the eavitios , if the body. In the coll stage of fever, acemdingly, and even in the most violent ague, when the teeth are chattering with cals, amb the whole surface is pale and clamny, the state of the system is well expresseal hy the aplorism of Virchow (the most ingenions and comprehensive of the motern exponents of the prathology of fever), to the effect that 'the onter parts freeze while the jnner burn.' Increasal heat of the body, therefore, is the most essential, verhajs the only essential phenomenon of
inver.

properties, but liffers in apparance, the segments of it.s lewes beimas fat and comparatively broat, and its fowers smaller. Its labit of growth is erect, its st win much lrameheal, and about $\bar{I}-2$ feet high. It has a strong, sumewhat aromatic smell. It was once

## FEVERWORT--FIARS.

a popular remedy in ague, and from time immemorial has been used as an cimmenatome. It is tmployed in infusion, and is stimulant and toric. A double variety is mot unemmon in sarlens.-Gi the same gemus with $\mathbf{F}$. is the Mayweeb ( $P$. innorum or $1 /$. jnor(ora), with leaves more resembling those of chammmiln, but alnost scentless, and lavge flowers, with white ray and fellow aise, very eummon in comfiehls and waste places in Britain and thoughout Enrupe.

 an erect, rownd, hairy, tistular stem, from ons to font fect hich, "prosite wrato-lancenlate entire leares, axillary whorls of Howers, with tuhular 5-lomod comolla, and leathery 3 -stetled lecries. It is a notive of Sorth Anerica, where its dried and roasted herries have been vecasionally used as a sulastitute for colfee; but it is chefly valuel for its mealicinal propertios, its ruots actine as an enuetic aul mill cathartic. It is sonetimes ealled Timher"g lioot, from Dr Tinkar, wha first lirought it into notiee.

FEZ (Ar. F'as), the chief and most northerly province of the empire of Narneco, vecupies the comntry between the Atlas Nountains and the Nediterrusean. Its popmation is estimateal at about $3,200,000$, eonsistinit of lierbers, Mnors, Arabs, Negroes, Jews, and a few Euryrans. The prowince is divited into tifteen listricts. Fly, the capital of the province, in lat. $3 t^{\circ} 6^{\prime}$ N., and long. about $\bar{j} U^{\prime}$ W., was founded by Muley Edris II., in the year 808 A. D., and was reckonell durimg the midalle ages-when it was the eajital of the kinglom of Marocen-one of the must marnificent and largest cities in the Mohammedan world. It is said to have contaned abont 90,100 a drelling-houses, and about 700 mosques, and was celebrated for its splendid pmblic luildings, selools, and seientifie institutions. On the remusal of the eurrt to Marnece, absut the midalle of the loth e., F. gradually fell into decay'. It is still, howerer, a place of considerable importance. The situation of $F$, is singular; it lies in a valley, formed hy surreunding hills into a sort of funnel, the higher parts of whicin are covered with trees, orange groves, and orehards. It is divised into ohd and New F. hy one of the upper lranclies of the Sebn, ant hats a monulation varimsly estimated at from do, min to nearly low,100) souls. There are 100 mosstues, of which the most iuplortiant is that built lyy the Sultan Iuley Edris, which contains his monment, and is an inciulable refuge for criminals, however grilty. On acconnt of its numerous mansures and relics, it is regarded as the In, ly city of the western Arabs. It has seven well-attenied schools. The old palace of the sultan is large, hat is now falling into decay. In other respeets, the external asjrect of F ., with its uunerous laths, cararanseras (nf which there are alosut $2(0)$, and hazans, resembles that of \$luhamneclan towns in queral ; the innltitude of hutels and shuls alme imparting to it a peculiar and more European character. A considerable trade is still carried on. ly means of caravans, with the aljuining countries on the s,mith and east, extending as far as Tmbultu. F. carries on manufactures of woollens, sashes, silk stuffs, girdles, sliphers, fine carpets, dec. Its artisans are also skilful workers in gold and jewellery:

FEEZZA'N (more correctly, Frsion), an extensive easis in the north of Africa, in $94^{\circ}-31$ I. lat., and $12-15^{\circ} \mathrm{E}$. hong. It lies south of the regency of Tripoli, and has a population variously estimated at from 7,000 to $150,0 \% 0$ souls. The north is for the most part hills, but the hills are composed of perfectly bare, black quartz saadstone, with no
rivers or hrooks amons them, and the south is mainly a lestl waste of dry sanil. Xint more than a tentl2 of the scilil is cultivalde. In the nei पhbourhood of the villases, which are situated manly in the wadies, wheat, barky. \&c., are cultivated. Camels anl borses are reared in consileralle numbers. Lions, leopards, hyanas, jackals, wild-cats, proreupines, vultures, ostriches. lizzards, \&e., are found in al,undance. The inhalitints are a mixel raee, of a brown colour, in many respects resembling the negroes, but are generally well formel. The oricinal inhalitants belonesell th the Bromer family, lint since the invasion of the erruntry by the Aralis in the 10th c., the traces of this native North African element have groulually becone very faint. The lancuage spoken is a compit mixture of Berber and Arabic. The prequle are far behime in civilisation, amb oceupy themselves with garlening and the manufacture of the most indispensable neeessaries of life. C'onsiderable trade is carried on ly means of caravans hetwecn the interior of Africa and the coast. F. is the Plazamia of the ancients, against which the Lomans, under Cornelius Ealbus, undertook a camparim about 2 e. e. C. During the classie berind, as well as in the mildile ages, it was trwerned by its nwn jrinces who were at first inlependent, but afterwarls hecame tributary to the pashas of Triy,nili, In the year 1542, $\mathbf{F}$. was conguered by the Turks, and since that time has remainect a Turkish nashalie. Murzuk, the capital of $F$., is a well-huilt town, with broal streets and a pmpulation if :30s. Serchandise valued more than £2,(ツッ) annually chances hands bure, aud of that ampunt the slave trale forms seven-eighths. Murzuk is now the great starting-point from the north for the interior of Negroland. Compare Barth's Tratels in ('entral Africe (Lond. 1857), and also the descriptims given of Fezzan by Denham, Clapperton, Oudney, lichartson, Dr Vogel, \&ec.

## FiAli. See Fee nud Liferent.

FLARS (rard said liy Jamieson to be of Gothic arigin, nul to exist in the same form in Icelandic). The fiors prices in seotlind are the prices of the different kinds of grain of the srowth of each county for the preeeding crop, as tived loy the sentence of the sheriff. proeecing on the report of a jnry sumnomed for the purmase, lufore whom the evilence of farmers and eorn-dealers is lroeluced. The values thus officially ascertained spree as a rule for ascertaining the priees of grain in all contracts where they are ins fixed lyy the parties: and in many sales it is agreed to accept the rates fixed by the fiars. Ministers" stipends. in so far as they comsist of grain, and crown dues, are also paid by the fiars prices of the county for each year. With a view to the latter, fiars, in former times, were struck in exchequer. An error in striking the fiars will not affire a ground of suspensiou.
The form of procedure in 'striking the fiars,' as it is callel, is reculated by Act of Sederiant. 21st Dee. 1723, renewed 2 ath February 120s. The time tixed by this act for summoning the jury is between the th and 2uth of Felmary, and the verlict must be returnel before lst March, old styly ; which is generally consideren too early, as lefore that time not much grain of the jrevinus crop has been brought into the market. Mr Barchay, sheriff-sulistitute of Perthshire in his Ihgest. gives the following account of this difficult and deliente 1 racess as practisel in his county. 'In Ferthshire, the fiars court is hell on the last Friday of Felmuary, or the first Frilisy of March. The jury consists of cight heritors, a few farmers. and some neutral parties, especally one or two able to check the caleulations.

An cyncraneal acenuntant is suonm, ame acts ass such. lat is mot ond the jury, and is pable a fer trom the eonuty rates. The list of the jury is shited avery alternate year, therehy givins suthectent

 take nue jurur whe" ather bail or receivel rents arconline to the tias: hat this erratly limiter the

 on an aphlication be the farmers, it was agreed to thetermine the dasiffeation ley tithing a certain woight as the puint of division. The first thing which the jury th is conserpently to inetermine the puint of whizlit. The witheseses are then sworn to the schedules. Which they receive after harvest, and in which they insert every separate guantity of Erain sold. With the dates imi prices divided intus first and secome classes, acendints as the jubgment of each witness dictates, and the weicht of each parcel. The rasults of the scparate schedules are inserted by the aecountant in a general sehedule. which is summel up by the accomatant, such memthers of the jury as and caphle assistios him. The result constitutis the fiars prices for the year. The same mone is mot adopted in lingland; but weekly averases of all errain sold at puldic markets are ascertainel aml bublished in the Geratle, and this is withont rospect to the prontuce of particular comatics. 9 licu. 1V. e. 60 ; a and 6 Viet. c. 14 ; If and 10 Viet. e so see Mistoricoll Acount of the striking of the Fiths in Scotlente, ly George Patersum, Esql., Adrocate, 1852.

FLA'SCO, a term borrowed from the Italian theatre, and now naturalised in France and termany, busiles heing occasionally used hy English writiors. It signities a failure to please on the part of an actor or singer. and is thus the aprosite of firure, although why the word, wheh simply means a motle, slamila nome to be thus alghed, is more than andomly knows. In Italy, it is not uneommon to hear an andience ery ont, 'rha, whe, finsors', even when the singer has only made a single false nate.
fl'AT, in Enclish Law, a short onder or warrant of stme julge for making out or allowing certain rrocesses.

## Flbeli. See Mcregtasif.

FibliE (Lat, fibret), a terw of wery common use as aphlied to abjects of a stringy or threat-like charater, whether of the aminal, regetalde, or minaral kinghum. Minemals are oftem lescribed as of a dibnus structure or appearance, in which there is, however, nu prssibility of dotaching the apmarent thibes from the gemeral mas, "r in which they are inflexible amel hattle if detacheal : but a more perfect
 varnety of Asbestes (I. W). For the seientitic use of tibre with requed to the animal kingham, we prfer to the article Hescles: for its scientitic use with regaral to the vegetable kinginm, to Vegethale: Trisice and to Woon arb Woors Fimee In its more promar, hat perfectly acomate nse, it inthates the han ur woul of quatrmaty, the silken throals of the enemons of salk-woms and ather inserta, the fileres of the laves ame of the inme bark of phats, and the chnuatede extls or hairs conumend with the salols of phants, fle ordinary mat mals of cordage and of textile falmics.

If mincral sulstances, amianthus alone has been used for textile falmies, and that only to a vary limited extent. Sumal and vegetalde flores have, from the emplest ares. suphied mon with cordang aml with cloth. How the invention took place, can - my bo matter of conjenture.

The amimal tilmes used for textile porposes are chictly of tho two diases alvenly mentioned-(1) the woul or hair of (quadrupedx, and (2) the silk of the cuecons if insecte. To these may ler ahled (3) the lissus ( $f$. V) of mulluses, but this Chass contaius maly the lyssus of the l'rase ( $(9.8)$ of the Malitorranan, anartide of ancient and hegh reputation, lnot more of curbinity than of use. The skins and intestines of amimals, although sometimes twisted or plaited for varions usess, can scarcely be reekoned annog the filmons materials antionded liy the animal kingiom. Fur information regarding the fibres whitinal from the comms of insects, see silk and silkwoma. It is to the first class that the greater nomber of ditferent kimls of animal fire used for textile phrpeses ledong: anl the wool of the shecp fir exceeds all the rext in importance. Sec sirfep and Wool. Lhat the wool or hair of other quadrupeds is also to some extent used, as of the
 the (samel (y. r.), the Bison (q. F.) the Musk Ox (f. v.) the lak (1. v.), and the Chinctilla (q.v.); all of which. execpt the last-and it has but a donbtfin claim to lie mentioned-are, like the sheep, ruminats. The hair of comparatively few amimas is sulbiciently lone for textile phrposes, or can be procured in suthicient abuntance to make it of economic importance. The wamelh of clothing depents much on the finmess of the hair, and on other characters in which woot particularly excels.

The useful regetalle fibres are far mone numerons and sarious than the inimal. They are obtainet from plants of natural orders very different from each wher; none of them, however, helongine to the class of acrogenous of crypocamons plants. They are obtained also from clifirent parts of plants. Thise which are terivel from exagenous jlants are ather the filmes of the inner lark (or Blis. q. 5 ), as flax, hemp, Se., or hairs of the fromt, as cotton. The use ful fibres of endogrenons 1 lants sometimes also belong to the fruit, as eoin or cocoa-mut fibre, and the uuimportant dilue of cottom-grass. The spathe of smue of the palms is sometinus also suffiegently fihnus and strong to be used for bags, \&e, without separation of its fibres; the filmes of the interior of the stem of old cocua-nut jalms are sumetimes used for eqarse lurposes; the fibrms character of the stems of the slemter phams called rattins, of hulrushes, \&e., fits them fur wicker-work, for plaiting into chair-lettoms, and the like; the roots of the Apmes. (II. v.) yield tilnes nsefnl for various purInses : hut generally, the more valuahle tibres ‥tained from entogenous plants are thase of their leaves, either of the leaf-stalles-as liassala filne and Gamuto on Fjoo filire, both prodned ly yams bur of the hade of the leaf, as line-aphle fibre, lita Flax, New Zealand Flax, Buwstring Ifemp, de. The tibres of the leaves of endengens heing parallel to each other, are easily obtained of sutficient lenth fur conomical pronses; whilst the reticulated tilnes of the leares of exomens, wen if long enough, which is comparatively seldum the case, cannot be Seprarated for use. The best filores of exogens, hewerer, are wiften of sufficient length, and casily spmalde. Their separation is generally accomMishel hy stee ping in water, wr ber frement bedewing wath water, so as to cause a partial rottine of the wher parts of the last and of the bark which covers it. but the filbes of endogens being in

## FIBILE-FIBRINE

general distolomed ant injured by this process to a much greater degree than those of exorens, mere mechancal monus are usually preferved for theiv stparation, suth as leating, massimf hetween rollers, ant seraping. Thu fibres of many leaves are seppro ated ly strapiner alome. The filures of fruitus ats cotton, exist in mature in a serarate state, like the Wonl or hair of animals, and require merely to be coblecterl and cleanctl.

I comaplete emmaration of the kimes of vagetalde fibre abplied to economical purpenses woulal nont he easy. Flax, II $m$, and fonton have lone had the preeminence. Tu these have recently bren admenl New Zealand Flax, Jute, Nimm or simm Jlemp, Coir, J'ita Plax, Abaen or Manilha IItmp, Jonstring Ifemp, 'hime Grass, Piassalna, and many others. New linds are contimally beiner hromblit numer notice, and to this industrial exhilnitions ind industrial musemms have most inencticially contributed. Now kinds, heswerer, ds not imbediately command the attention they deserve. "ll a now product is sent intu the maket, says I)r lioyle, "few of the reanlar customers will liny it, as they want that to which their machincry and manfactures are suited.' But for the juligim"ut and enterprise of Mr salt, it might have been longere alpaca wool had olitained its lresent flace amoner the materials of wir mannfactures ; and there is much reason to think that many vegtable filores, now little regarded, mas get in like mancr bre exalted to impurtance.

For the use of vegerable fibres in the mannfature of pajer, see Paper.

Frbrous I lants. Without attemptine a comoplete enumeration of plants whieh yithd filures employed for economical purposes, we wive the following as a list which may be useful. Nany of the subjects will be foumb treated in sepratate articles, or more fully notiend undel the natural orders. The most important are indicated by capitals.

## I. Exogenous Pidints.

## 1. Fibres of the Fruit.

## II. Exdogexnces I'LaNts.

Nat. Orel. Lilliucter.
New hedtaso Flax, filure of leapes of Phorminm pener.
Fowstring Memp, filare of laves of spucies of Sunseriera.
Fibre of leaves of sleceits of ATwe and of Fucco.
Atmaryllidece Joita Fliax, dilare of leaves of Atwate Amertretud.
Fibre of leares of suecies of Fourcroy:
Musecce Abaca or Manilla Hemp, and Plantain Fibre, chtained from leaves of Slecies of Jusat.
Bromelimece. l'ine-apphe Fihre, Curratow, Sc., fibres of leaves of species of $H$ romulia, Nc.
Pendenrecer. Fibres of leaves of Sicrew- jines. P'ebmecect Conr or cucon-mut tilure, from husk of cocor-mont. Fibre of cocoanmat stema. Gumuta or Ejoo fibre, from leafstalks of IFomntu lialni (Arenga daceluerifiret.
Piassaba, from Aftulor funifiref and Lemolebinit Piessatore (the Chiquichinui 1"ahn).
Other fibres from leaf-stalks, die, of many palms.
Cipertece. Fibre from leaves of Erionhorum rennubintem (sue CuTtos-grass). Mats, chair-lootoms, \&c., made of tifferent converuces.
Gounincer or Crasses. Esparto (Stifut tome (rissimat).
Mronja (saccluervm munju).
FlERINE is an oramic comonound, occurring looth in animals and plants. In its elemical combosition it closely resembles allommen amd caseine, inni it was until recently believed that these three substane'es lussessed a common radical, to which the name pootine (from prohoo, I am first) was given, the broteme lowing rewarded its the primary hasis of all the tissum of the lomy. Hence we frequently lind dilmine deseribed as one of the wroteine lodies.

Filmine is manly distinguished from the allied substances, allumen and caseme, ly its separation in a solid state, in the form of extremely delicate tilaments or lamelle, from any lharl in which it is dissolved, very shoretly after the alostraction of the latter from the organism.

Animal filorine, which is of the greatest physiological inportance, oceurs principally in the lifood, the lymulh, and the chyle. In oreler to ohtain it in a state of purity, we leat or stir the blow with a lomdle of twigs, to which the tilame alheres in strings. The impure filurine thes uhtainetl is then rinsed with water, boiled with alcohol and ether, - to remove fatty matters-amd tried. In healthy venous blood, it scarcely erer amoments to 3 in 1000 farts, its arerge quantity lreing 23 , small, how. ever, as its amoment is, it varies more than any other constituent of the blom, and in acute inflammatory discases sometines exceds its arerage liy tive or six times. Morover, arterial hood contains more dibrine than renoms lilood. In the lymph and chyte, it occurs in consibleralily less puantity than in the 1,loud. In inflammatory exudations, we tiat fibrine in the contents of the serons cavities-as, for

-xample, of the plena and peritomem-and on tho matons mombane (ass in (romp); in thate
 conenlation.

 onsent tham athumen, it has leen iniferend that it is formen from the latur by a powes of onnation. As, huwetr, more tibrine is fonat in the lami in formania- when ar considerable pertan of the lunzo is remberal impervinus to air - than in almost any other disense, wo are inclumal thent the "pmosite hyputhesis, that the aummotan of the filmoe in intlammatory howh is cancel by an insufficient supply of orysen. Whan wyen is abundants introntural inti, the Mand, the tilnine rabilly mikenes further trandmatinas: on the
 rathen, the ghantery of exy converd the the liend is mot sulliciont (o) , flect the further momal oxidation or tramsiomatha of the tibrine, we have an acmmation of that contitnent in the carenating: 1lual.
It has, lumewr, bem a diguted ghestion, whether flbrine is pranlaced in the elathatation or in the disinterathon of the tissues. For the disension of this suliject. aml of wther pinints comaected with thrine, we must refict to Lehmam's Physiolegical

The substance forming the mass of flesh or muscular tissme was formory rerarded as identical with coundatod hand-iblime. The two substances are, howeref, chemially distinct, and the muscle-tibrine will be described mader its new chemieal mame, SYNONDE (from sunteinein, to eoutract or reader tense).

## Fllbrols Tissle E. See Trssem.

Flchiti, Jonasy Gotclimb, an illustrions German phinhpher, was horm at Kammen, in [yer Lusatia, 1sth Nay lowe. Ilis earliest vears weme marked by a lowe of solitary musing and meditation. When a mere chili, be was wont to wanter forth to mphand tiedes, that be might enjoy the pheasure of wazing into the illimitalle distanes. In 1703, be was paced at the grmasium of Porta, near liamlary; and in 1800 he entered the university of Tem, where he devoted himself at first to theology, bint afterwarls to phalosepha: During the rears 1741 1585, be supportel himself in a precarions way as tutor in various saxum families. Subsequintly, he went t" Zurich in a similar capenty. where be male the aeguaintaner of the exerllent laty whe atterwads hecame his wife, Johanna Maria Liahu. In 1791. F. ulatamed a tutorship at Warsaw. in the honse of a Phish momeman. 'The situation, hawerer, provel disagecalle, ant was thrown up lig the fastidinas philosepher, who next proceded to K unitalng, whore he had in interview with Kant, of whim he had lecome an ardent diseiple. Hare he wrate, in 1792. his kritik aller Offertorumy (Critigue of all Ruvelation), which he shewed to that philumper, whe praised it hiohly, but still maintainal a certan air of reserve towats the "nthusiantically carmot author, which pained the lattor ateatly: it Kimisebere, F, was reduced tu such straits for want of the mans of sulsistence, that lue was forcel to akh the lowin of a small smm of maney from kant, which the later was stajeal

 fomme if the Comut of Kroknw, near banky, als thtom: wis emahlet to inarry : and in 17!日 was

h. commoned to expmum with extraordinary zeal his eystem of transemdental idealism. F., in fact, peracholl his phifosply as if he believerl its recep. tion ensential to the salvation of his hearers. In
 a sidnce). 1 which he clarly ioroke away from kint, where spendations ald not seem to him sufficinatly thorough, or, as Englishmen would saty ihmitistic. Impocl, as carly as 1793 , writing tw Niethammer, he says: 'Sy conviction is, that Kant has only indicited the truth, but neither mandued nor proved it.' An accusation of atheism, which F. fervidly lout fruitlessly refuted, cost him his chair in 1709 , In the previms year, he published his system der Sittenlehre (Nystem of Ethies, Jena, 1798, consilerel by many to be his most mature work. He now renoved to lerlin, where he delivered lectures on philosophy to a select anditory: In 1 som. apreared his Lelor die Bestimmengen des 1/nuchen (0n the Destiny of Man). In 1805, he motaned the chair of Philosophy at Erlangen, with the privilesp of resilimg at Berlin in the winter. Hare he delivered his celehmatad lectures, Ueber das Ḧsin des ciolehten (On the Nature of the Scholar, lerlin, $1805-1806$ ). In the same year, appeared his timolsüge ths tfognuärtigen Z̈italters (Characteristies of the l'resent Age); and in 1806, his Inncivuly sem whim Leben ofler die heligionslehre (The Way t": the Blessed Life, or the Doctrine of Leligiont bat $F$. was a patriot as well as a philosopher. The victorics of Xaponem at Auerstadt and It ma drew fortla the famons Richen an die Deutschen (Adherses to the (iemman). These addresses were full of the most exalted enthosiasm. F. 'laments that his age has denied him the priviloge aceorded to Werhylus and C'ervantes, to make grod his words by manly deeds.' The P'rassian king appreciated the peal of the eloquent metaphysician, and, on the restoration of peace, requested him to draw up a new constitution for the Berlin University. In 1810, the university was opened, with a host of brilliment names, F., Wolf, Hüller, Humbodt, De Wiote, Schleiermather, Yeander, Klapoth, and Saviny. Fy the rotes of his collewues, F. was manmonisly elected recter. INere, as at Jena, he laboured with umemitting energy for the suppression of all those chstoms which he deemed harbarous in themselves, and incompatible with the true idea of a scholar. In 181\%, the war of independence hroke out, and the huspitals of the Prussian eapiatal were soon crowded with patients. F''s wife was one of the first who offered her serviees as a nurse. For five months, she tended the sick with all the pationt tealerness and devotion of her mature. At last, she was seized with fever, Bul January 1814. diter a fearful strugale, she recovered; luat her hushand canght the mfection, and in spite of all remedies, sank under its influcnee, and died 9 -th Tamuary 1814 . It is dificult to speak calmly of Fichte. IIis life stirs one hike a trumpet. He comhines the penetration of a phalosepher with the fire of a proplact, and the thmmer of an orator ; and over all his life lies the beanty of a stamless purity. See Fichte's Leben und literarivehor Priefuechas (puhlished ly 1. HI. Fichte, 2 vols. Sulzh. 1831-1S31); :mu W. Smith's Memoir, published by Chapman and Inall (Lonel. ISts). Tlae fundanental motion of the idealism set forth in F's writiugs, at least in the cartior of them, is the sule reality of the Eyo or I, which jusits both itself and the Non-ego, or Not-I. 'The phase 'to pesit,' it mught to be observed hore, signities in dierman metaphysies, to present to the consciousness. Ilence, when it is said that the (!') posits itself, the meaning is, that the ego lopemes a fact of consciousness, which it can only weone through the antithesis of the non-ego.)

Under this ego，however，must not he understond， according to the usual misarprehension，the human and finite，hat the＂alsolute subjuct－qlijectivity＂ （absolute sulject－objectivitut），the eternal，universal reason．The egro is the alsohtely motuctive， which，however，would not attain to conscions－ ness of itself－i．p．．of its infinite slontaneons activity，dinl it nut at the same time place in contraist to itsclf，ame as an inveliment（ensitus．s） amd limit to its activity，the nonee－n－i．e．，the olopective worlh，or mature．The egin，in so far as it is determinel ly the non－apo，is the intelli． Went euro，and，as such，the suliject of thematical selince：the ego，on the nther haml，as reter－ mining the nom－ego，is the suloject of practical science，F＇reetom，ahsulnte，suntanems activits， fur its awn sake，is mot with $F^{\prime}$ ，as with kant，the
 is itself the lighest expressing of the problom of the monal law．To realise this self－untivity，how－ ever，the cgo requires an external world of objects， in orrer that in them as limats it may hecome com－ scions of its own activity：To this inkealistie system of cethics it has been phansilly－some think mo answemaly－oljected that it makes the nom－ego he requiral as the comlition of morality：and at the same time remesents the remavial of this condition as the aim of moral c／fort．With respect to the idea of richt，F．＇s theory of fretemo in its funda－ mental primciples，attarcheal itself to the Kantian theory of freslom as the innate and primitive prim－ ciple of right．Geberally speaking．F．makes that which，from the stamel－pint of ominary conseions－ ness，we call the work，merely a product of the eg口； it exists only thrugh the ego，for the en＂，and in the ego．F．himself afterwards maxlifit or extembed his system，so as to lring out mome rominantly the theistic character of his metaphrice．The tran－ sition to this later stage of F．＇s philusenthy is seen in lis bestimmeng des Mehsohen（1）nstination of M m ）．It aruse from the intense religiosity of his nature．F．was essentially a worshiphing nature， ant thongh he never ceasiot to be a philoswher，the untiring aspiation of his later years was to realise in his own way the belief of the great Jewish law－ giver：＇The temal Goll is they refuge，an？rom？ thee are the everlastimg amus．＂A pammar expusi－ tim of his philosonhy is miven in his A Ancoisum！zum ＊ligen Lelm．It is set forth in a strictly scientific manner in the loctures pullishowl in the Pecheffer． wemen Jrome alitel ly I．A．Fichte（3 mols．Bomn， 18：3t－183．5），in which his spucutatice Logik and his reviselt the ory of right and monals are particmlarly eluserving of attention．Wlthough F ．Hercr，strictly speakins，formed it schonl，ant thongh his system has only，been akmitel by a few，such as J ．1： Schad，Mchmel，（ramer．Schnidt，and Michaclis， his intluence uph the subsopunt idevelopment of German philustlpy has been vary impurtant．Fi＇s collective works have likewise heen phlished by his som，1．11．Fichte．His l＂pular works have lreen translated into English hy IV．Smith，am？ puldished ler I．Chapman of Lomton in his Catholic Series．Their tithes are－The Destinntion of Men， The I＇ocation of the sholar，The Stuture of the Scholur，The líty be the Brastal Life，and The Characteristims of the Prosent $A$ ！$p^{\prime}$ ．
FICHTE，Mmantel llemans，son of the former，and professor of milusophy in the univer－ sity of Tübingen，was horn in $17!7$ ，and early theoted himself to philosndical studies，heing attracted hy the later views of his father．which he considers were essentially theistic．He also attended the lectures af Hegcl，but felt averse to his mantheistic tentencies，and lemed more to Schletermacher and Schelling．Occupied at first
as a teacher．F．was apminted wrefessor of phido． sophy in lionn in 1836 ，ant in 1842 receiveel a call to the miversity of Tiblingen．His chief wnoks are－Liritrigp Ein Chumeteristik der nenem Philosophie（1841），lirund：ugp aun Systome der Philosophie（11eidn．l．1s39－1847）；Systom dur Ethik （Leip．1850－1851），and Anthopoindim，wher die Lehre ron der Mr mashlithen Sith（Laid，IS．O）．IO suggesteal mectings of phidompars similar to those helif ly physivists；and at the ome held at（intha， 1817．he deliveren an uldiress on the Philosmphy of the Future（Stattg．1817）．The great aim of his speculations las luen to timd a philosulhie basis for the personality of Gud，and for his theory on this sulject he has proposed the term romerte Thrima， to llistingnish it alike from the alstract theismo which makes fool almost an mareahty－a harren agencerate of lifeluss attributes；and on the athor hand，from the all－ahsorling pantheism of Hurel， Which swallows up the human and the divine in its own imaprehensible totality．Powently， Ir has puldished an important work，Zom hitelit－ Iroge，fine Phitowophistho Confission，which has luen translated into English hig J．I．Norehl，unlur the title of Contrimations to Mentul Philustiphy （150日），for ans accont of which see art Conselots． xEss．buring the movements of lats，he issmed sureral pulitical tracts．The priuciple of $F$＇s phlitics is not unhlet Dr Arnolds maxim．He hohls that there is only one kind of real conser－ vatism，that of constant well－plamnerl refimn ；and that all revolution consists eitler in attempts to precinitate prematurdy the future，or to go back tin inleas that are eflete，the last leeing anly the chrysalis form of the first．The state，＇according til the inlea of bencrolenee，bolongs to the futione． The regeneration of Clristianity mond comsist in its becoming the sital and organising power in the state，insteal of heing ocenpicil solely，as heretofore，with the salvation of indivituals．To this revent school of philnsophy belong Wisse， Chalywas，Wirth，anl others．
FICI＇天O，Marsilio，an illastrinus philosmper of the Italian Ilatonic sclmon，was borm at Florence 143：3．Il：was the son of the mincipal physi－ cian of Cosmo de＇Merlici ；and tu the liberality of this prince he owed the classical cultare which inspinet his future carerr．At the sugerestion of C＇osmo．1．nadretonk the tramslation of l＇lotious， Jambichus，Irochas，anil lorplhyry，besides a Latin but ly no means literal version of Plato．In 1463 ， he was apminterl ly C＇osmu president of a classieal suciety or acalemy，fomaded in 1410，haviny for its aim the diffosion of the llatmio metrines，which F．beld to loc the basis and contirnation of the Christian system．On the death of Cosmo，$F$ ． fomed a no less munificent patron in this prisce＇s grandson，Lorenzo de＂Mledici；aml having，at the mature age of 40 ，decidel on entering the church．he was endowed ly Lorenzo with the recturship of two churches in Florence，and a canonry in the eathedral．His theolowical doctrine， while untouhtelly sincere，presents a strange nedley of inconymons views，the natural result of his attempt to fuse the philosoply of Plato with the Christian ereal．Ite died in 1400 ，and was interreal in the cathertal of Florence，where a monument commemorates his upright and manly qualities no less than his learmin and philosempy． F＇s collectel works were malished at Basel（ 2 vols． f．1491），and consist of translations from the Greek philusmpers，and orininal metarhysical and theo－ logical connositions，if which we may mention the Theoloyict Platomior，De licligione Cileristiana，the Latim inpistles，and a Commentary on the Epistles of St Paul．

## FlHDLE. S'e V'mbis.

FHDElCOMMISGLM, in the Civil Law, was a convenuce of pronery in trust to be transferred to a thided persm named ly the truster. Fildecomminset, when first introluced, were not surperted by the law. The performine of them dependet, therefore, on the cuncicace of the party intrustel, and they were comsequatly frequently not carried out. They wore origimally alnated for the purpose of couveying promerty cither where a party, from the ciremastaners of the ease, an imbility to preme the preper mumber of witnesses, wats prerented from oxecoting a will: or where he desired to bredit thome wh, by law, were precluded from taking the pronerty: To eflent this purpuse, an actual comveyance vis male to a fricmb, coupled with is refuest that the promerty shantel be tramsferred to another. Fideqummisal baving thas been intronced for a special furpose were by degrens extended tor comeyances of the whole inheritance, and finally were used for the gurpose of settling eatates in ir particular oredr of suceession, formins the entiest mstance of Entails (g. vo). Fideiemmmissat lirst received the samenom of positive law in the ruign of Angustus, ly whom anthority was given to the practor to enfore the perfurmance of these finuciary ohbigations,-Institutes, ii. ©3. s. 1. Thu Emperor C'laulius subnemently extended this authority to the comsuls and presidents of provinces. Fillecommissa were cither perticuler or uniorsal, the former being a lenpest of a partionlar sulject, wr a part only of the inheritance; the latter eomprehembel the whole estate.

In Hollomel, the principles of the civil law as to hideicommissa form an important brimel of the law in regarl to landed cestates. An huir may bur required to transfir either the whole or a portion of his inheritance, 'l'he provisions of the אematnsC'msultum Trehelliamun also have leen adopted; but if an hoir resist the intentions of the testater, and is comprelled ly law to excente the trust, he is not allowell to take the benctit of these provisions. The benelit also may be exeluled by express direction in the will. "hilam who hare receised their lesal portions, and are repuired to transfer to a stramger the rest of the imheritance, are entitled to ritan a frumth part for themsilves. Grotins, Dutch I mrispredemet, by H erbert, h. ii. e. ©0.

FIDICOTLA, is small musideal instrument in the shape of a lyre.

FHELD. In Jleraldry, the field is the whole surfien on emontinent of the eseutehem or shield. It is shealled, aceording to some, because it represents

## FIELD-ALLOWANCE-FIELIING.

the field of battle on which the achievements or charges reprosentex mit are supmosed to have been gained. In bazoning, the tincture or metal of the field most lre the first thing mentionerl.
 granted to othetrs of the british army in considevation of extra expense entailed mian them in consequence of military operations. firlinary tieldallowance, rancing fom $\pm^{\prime} 1$, lfs. for a meneral ufliecer to $1 s$. for a subaltern, is applicable when tronge are concamper at home or in the colnmes. firtreordiner? tielel-allowance is sanctionmi wlent aml wherever tromps are cheaged in actual wariare: it
 Strict rales are laid down that an officer slaall receive this allowance unless fositively luesent with the amay.

FIELI)-GLASS, is the lems nisually interposed between the bbject-olass and ero-mlass of a micro. scupe, whels, receivine the diveremer rays form the former lofore they form an imaste, eontracts the dimensions of the image, ant increases its brightness, so as to remler it of a brane size and degren of vistinctuess for locing vieworl ly means of the eye-glass. see Field of Vilw, and Michoscore.

FIELI MAISHAL, the hiothest rank of perneral officers in the British and smon forcien ammios. In the former, it is a special lamone empayed by vory few officers, and wnly conterred lys selection, either on the oroums of distinctusherl sorviex or of royal hinth. When unemployerl, the fielil-masshal has mo hirgher Pay than any othor gemesal, but if commanding an army, he receibes むth, s.r. Ite, a day for stalf-pay, while a general has but $\pm 9.0$. Gut. The equivaleat rank in the navy is that of atmiral of the fleet. Formerly, a captain-ornoral was occasionally appointed, who had rank higher even than a fieki. marshal.

FIELD-MOUSE, a name populary fiven to certain species both of dutse and of Vobe. See these articles.

FIELD-OFFIC'ELS, in the Amy, are such as are competent to command whule battalions-vi\%, majors, lientenant-colonels, colnumb-in contradistinction to those merely intrasted with comprany daties, as captians, lieutenants, and easigns.

FIELI OF VIEW is the whole space within which ulajeets can he seen through an optical instru. ment; more strictly, it is the space within which the imare of an objuet may be seen by whole ]encils. That part of the imase which is seem by partial pencils of the light from the object speendun or lons is called the rumped cultp, anel usually a diaphragm is employed to eut it ofl from the verw of the observer altugether.

FIELI)-TRAIN, a icpartment of the lioyal Artillery, consisting of commassaries inm con luctors of stores, responsible for the safe constonly of the ammuntion, for the formation of broper depots of slot, \&c.. luetween the front anl the lase of operations, and that a chue propurtinn shall lie constantly at the scrvice of each gon alurimg an enwargment.

FIELI. WORKS are intrenchments and other temumary fortitications thrown ny has an army in the fiedu, either as a protection from the onslaught of a hustile force, or to cover an inttack upon some stronghold. Fiell-works will be more garticularly described inder the article Fnatifucatos (ig. V.).

FIELDEALE (Tatus pulutis), a species of Thrush (q. v.), in size about equal to the hackbird, but with greater length of wins; the general coluur gray, the feathers tipled with a brownish black elungated spot; the thruat and bruast reddish
yellow streaken anl spotterl with liack; the forepart of the back anl whus of a rich brown colone ; the tail slightly forkend and nearly lack; the nnuler parts white. The $F$, is a wry ommon winter visitut of Siritan, althomeh it rarely breteds even in

Fidulfare (Turelus piluris).
the nortlieln parts of the jslam?. It arrives from more northern rerjons when the winter has fnlly come, amb leparts again towarls the ems of spring. It is well kunwn to jonthful sportsmen, and afforils umel employnost for their guns luring the 'hristmas holinlass, whom it may renerally be fommd in small Hocks-often along wifh its smaller congener, the reatwing-in follds, if the weather is milu, feedins on werms, stails, \& \& , or, in severe weather, about halges, thickets, anel wools, wherever haws and wher such fruits or soculs are ahmmant. Its winter migrations extenl sonthward as far at least as the islanels of the Deditermanean. It is one of the summer sonnsters of the north of Eurape aml of Kiberia; its song is soft and melodious, hut is much less familiar to us in Jritain than its callonote, which is harsh. It is extremely phentiful in Nurway, where its nests are very generally built in spruce firs, and, contrary to the ordinary hal,its of thruehes, in sneiety; numerous nests heing often to he found in the same tree, and 'two homilred wests or more beine frepmently seen within a rery small space.' The $\mathbf{F}$. is easily tanerl, and sings well in captivity.

FIELDING, JIExny, born April $2 x, 170 \%$, was the son of Guneral Elmund Fiehling, connected with the Earls of Denbigh. He was sent to Fton, anl was afterwards transferred to the university of Leyalen, to prosecute legal studies. Returning to Londun, he began to write for the stage, amd worked with so much industry that between 17:5 and 1736 he prorluctd nearly a score of eomedies and farces, which were forgotten with nealy as much speed as they were promluced. Ite narrieal in 1736. and falling heir to a small estate, he, with his young wife, retired from Londem. But his was nut a Fortmatus's purse, and his ham was continnally in it ; and in thre years after his marriage, he was back in London a studest at the Temple. He was called to the bar at the usual time, but gout intervening, stealy practice was rendered inpossible. Iapply, a way of escape was at haud. Kichardson published Pumclet : the tuwn was rimging with it; and F ., whose strong, healthy, mamuentional nature revolted from the moral jriggishness of 'Virtae Tewardell. resolved to write a counterpart, pur. porting to be the andyentures of $f$ 'amela's brother. Joseph Indrews. This work, bogrun in a satirical mood, and intendel merely to quiz Richardson, deeprened as it proceeded, and Howered ont into lumorous alventure. 'The exquisite character of

Cars n blams fonk the work ley surpisis, amb

 layaty, be was, thanght the intluente of land Liteltun, promoterl to ab fonsinn, and to the flaw. of justice of the perbe of Mildlesex and Werstminser. While engaced in movisterial duties, he prowhean? \%ion Jones, his most fimons fiction, whill the world has never enased to real, por eritios to atmine. Ilsw nat work was atmelia-loss striking and masterly than its predecesson, lant pubeter
 tennlamos. Shortly after its pmblication, he was
 Whatmo of dinnalers which batlleal the skill of the
 Lislum on the ebth onne lizit, and died there on than ath "equbur of the sume year, at the early age of in inty-swan.

1* wis the tirst mat Enclish movelist, and he remans to this day one of the irreatest. Iom Jomes is a miracle of iuvention, character, and wit. It contains the must ammsins seemes and adventures, the mast sparkling delincations of life, hioh and low, the most ahmomat satire. Biverywhere, the author's manliness, shrextl sense, and seorn of meambess and hypourisy, are apparent. If defects may lee hinted, it may be sidil that l'.s nature was more robust than delieate; that it was delieient in the sentimental and pretic shete; anl, as a comemuence, that his ideal of woman is mot hioh, amI his desariptions of the tender pasion cither commonplace or extraviagntly rap throns. 'The bowe-senes between Ton aml Sophia, and the epsimbe of the 'Man of the Hill,' which is meant to lee prissionate and puetic, are perhaps the only purtions of the great novel which readers skip. It is to be remetted that all F .'s works are distigured by coarseness of eicumstance and expressinn: lout that was the fand of the time as much as of the man. He was coarse, as he wore rulles, lrank elaret, and hated the Pretender. He sut himself to paint suciety as lo saw it, and we must forgive the conrseness for the truthtidness of the picture.

FIELDING, Copley Tanoyke, an Erichisiy painter in water-colours, was horn about 1787 , and began to exhibit in 1810. For many years he held the oflice of Prosident of the Society of Painters in Water-enhonrs, and was generally recognised as the representative of that branch of art in England. He dial at Worthing, in Sussex, Mareh 3,1555 , in his Coth yurr, ane after a career of stealy posprity. lousessing remakable mechanical dixterity and knowlelre of effect, $F$. panted with what severe erities would call fatal Tacility. IIe eontribinted alout a seore of pietures annually to the exlibition of the Water-cohmer Society. But, to do him justice, Le always exhibited a certain easy finish of treatment, Which was perhaps of itself a kind of secondary talent. Althongh his range of subjects was but limited. fort withon it he was amost morivalled. As a painter of marine diects, and of the landscapes of flows anm ghule, it is thonght by many that he has land as yet muegual.
 conrt in use amme the carly Gothic nations. This conart was establishod for the purpose of rendering epecely justace in mall mattors. There were four of
the se comuts in every hambred, each presimed wer by a sepurate judec, whose jurisdiction extended to aill ":uses where the matter in dispute did not exered the sum of three marks. Stiernhook, De Jure Goth. lsh. i. c. : $\because$.

JI'GRI FACIAS, Writ of, an English writ for "nforcines the judgnent of a court of law against the combls of a delotur. It maty be sued out as soon as final judgment has heen signed, or, in case of a trial out of term, in fourteen days after verdict, unless, on spereal canse shewn, a judge order spedy execution. lont a writ of lieri farias eannot bu enforeal after a ('apinsal wutisfiuciondum (4. v.) has heen issued. 'The sherity, in execonting this writ, may not break open denors: Int having obtainal peaccable entranee, he may brak yun inmer doors, cupmards, and trunks. 'flhe stheer in exeention having taken jossession, may lowve an assistant in charge, $l, y$ whom an inventory of the gombls is male. We is entitled to remain on the fremises a reasonable time, in order to remove the goons: but if he eontinne longer withont permission of the owner, he is liable to an action for trespass. By 8 Anne, c. If, if goods are removed from lamd or pronises let on lease, the party removing them must pay the rent and taxes. A erolitor may mot take, in execution, mannre, hay, \&o., where, by the covenants of the lease, the temant is prohibited from removing them ( 56 Giro. Ill. c. 50 ). Growing crops, if seized in exeention, and sobl, are liable for rent acerning after the late of the seizure, as long as they remain on the ground ( 14 and 15 Vict. c. 25), Ly 1 and 2 Vict. c. 11a, money, bank-notes, bills of exehange, and other seenrities, may be taken under a writ of fieri fitcias. By S and il Vict. e. 127, a ereditor is not entitled to take weaing-aplarel and bedding or tools where the valne of the whole does not exceed $£ 5$. . Such fixtures as helong to the heir, and not to the executor, eannot be taken moler this writ. The roorls of the party only who is named in the writ may be seized ; and if the otheer take gronds belonging to a stranger, he is lialle to an action for danaiges. By 1 and 2 Vict. c. 110 , decrees and orders in Chancery have the effect of a judgment in a court of law, hence, fieri facias and other common law writs proceed upon the former as well as the latter.

Fierifiaciues ale bonis ectlesideticis is a writ directed to the bishop of the cliocese, reyuiring him to attach the ecelesiastical gools of a clergyman within his diocese, in satisfaction of the judgment of a court of law.

HIE'SCHI, Count Giovanni Lutgi, a member of onc of the most illustrions Houses of Genoia, was lorn abont the year 1523 . In adidion to the lustre of ancestral fame, his mame has attained a traric liatorical eclebrity in commetion with a remarkable conspriacy of which he was the chicf. Andruas Doria, a famous aulmial, sprung from a race herelitarily at feud with that of F., having expelled the forces of Francis $I$. from the state, had restored the republican form of movernment, hut at the same time, by lis viforous administration, effectually hedd in check the ambition of the nobles. Count $P$. ormanised a plot, having for its object the death of Brrin, and his nephew Fianctimo, the olyject of fe's special hatred, aml the establishment of an obizarchic form of govermment. Instigated ly the aproval of France and liome, and supported by in allinnee with the Iouke of Parma, 15 , speedily wurolled a furmidable array of aecomplices, his there lirothers amonis the foremost. Crowds of his own feudal retamers were secretly armed and assembled from the varions hereditary lands of the Jlouse; three galleys, burchased with the connivance

## FIESCHI-FIFESHIRE.

of the rope, were fully equiped, and all being in readiness, the attempt was fixed for the of of Jamuary IFta. Doria, in spite of repeatel warnings, refnsed to ascribe treacherous or subversive designs to $F$., whom he regarded as a fast friens and partisan. Complete success scemed at first to crown the conspirators; the gates of the city were forced, the Heet captured, Gianettino assassinated, Duria in Hight. Fi. haw lut to appear and dictate, but he was nowhere to le foum; ; and the strangest episode of this whld drama is the suden hisalyearance of its hero. In steppins from one galley to the other in the darkness of night, $F$. stumbled, and falling overtmard, was borne dowa his his ponderons. armone and miserably drownel in the hathone, or, accurding to sume, stitled in the slime.

FIEsCHI, Josepa Marco, known by his attempt on the life of Kin's Lours Philiple, was horn in Corsica in the year 1790. His carly life contains nothing of nute. A prolligate carcet apmears to have reducel him to great poverty about the year IS3.5, when fo conceivel the dea of assassinating the king. The immeriate cause of lis diabolical desion was the suplression of a situation which he hell, by order of the prefect of the Sene. Disguising his crime muler the cloak of political enthusiasm, he leagucl with himself one fir two obscure persons, of pothonse phitics, who hated the grivernment of the Citizen King. These were I'ierre Inares, a saddler; Pepin, a groeer; and Tictor Boirean, a maker of lamps. $F$. sketcherl the phan of an infernal machine with twenty barrels, that conk be simultanconsly discharged ; got one mate, and placed it in a house of the Bonlerard du-Tumple. The review of the Satimal Guard held there, Esth July I835, affordal F. the opprortunity he desired. On the approach of the ling and queen, he fired his machine. Eighteen people wore killed. among whom was Marshal Mortier, who fetl dead beside his sovereign. Louis Philipre, however, himself escaped with a mere scratelt, and was able to continue the review. F. was immediately seized, and along with his accomplices, was trien, condemned, and executed, 16th February 1836.

FIE'SOLE (anciently, Forsulet, one of the most aucient Etruscan cities, is sitnatel un the crest of a hill, at alout three miles' distance from Florence, of which it may be said to be the prarent city: From the heights of F., the view presentel by Florence and the neighbouring valleys is gorgeous in the extreme. We find $F$. first mentioned in 225 b.c. during the great Gaulish war. Hannilnal encamped here after crussing the Apennines. The city was next destroyel hy Gulla in the sucial War ( $90-89$ e.c.), who aiterwards thespatchel thither a military colony. At the invasion of Tuscany by the Goths, F. also fell muler their commion, anil being by nature and art a fommiable stronghold, was numerously garrisoned liy the barbarians. The growth of Florence during the miblle ages graiually reduced it to insignificance. It is now a place of about 2300 inhabitants. The only restire of Etruscan structures still remainint is the evelopean eity wall, constructel of huge Blocks of stome, many portions of which are wouderfully perfect. The site of the Etruscan fortress is now occupied by a conrent, and interesting fragnents of the fommations are often brought to light. The ampuitheatre and other remains helong to the lioman age. The very ancient church of St Alexamler, supposed to have originally served as a pagan temple, contains an altar dedicatel to Baccuns, the inscription of which is, however, illegible, owing to a tissure in the midde. Coins and other relics have been repeatedly dug up.
fiesole, Fra Grotamia da, ofe of the most eminent regenerators of Italian art, also known by the title of $I l$ beuto Angelico, was born at Magello in 1357 . In 1407, he fitered the Dominican orler, ancl, together with lis brother, consecrated his artistic abilities exclusively to sacred ams, illustrationg various works of devotion with heautiful miniature designs. These carly artistic efforts are remarkable for their rich elfects of colouring, gorgeous illumination, and expuisite claboration of the most minute ornamental details. Having achieved a high reputation as fresco-painter by some nolle compositious with which he cndowed lis awn and other convents, he was commissioned by Cosno de Medici, with the decoration of the church of Santa Annuzziata and the convent san Harco. Each cell of the conrent was alorned with a fine frese of large cimensions, and amillst other laintines, one can still distinguish $F$ ''s 'Amunciation.' The fame of this work indueed Pope Nichulas $V$. to snmmon him to liome, anel intrust him with the execution of a series of illustrations taken from the life of st Lamence, destinel to coubellish the private chapel of st Laurence in the Vatican. Sce Gianciacumu liomano, Le Pitture delle Cuppello di Fieoto 1., de. (İme, 1810). So rigill a disciphimarian was F., that no private or public work was ever undertaken withont the formal censent of his superiurs leing oftained, and to then all peouniary remuneration was transicreel. The archbisherric of Fiforence, spontancunsly otfered him by the fore, was humbly declined. ITe died in Rome in I454. The gallury of Florence possesses several pictures of $F$., still undimmed in lrillimey of coloning. One of these, the 'Birth of Juhn the laptist,' is a conception full of simple and wimuing grace. Some of the larcest casel-comprositions of this artist at present alorn the gallery of the Lourte: amons those in the antechamber are the 'Coronation of the Virgin,' and the 'Miracles of St Dominicn.' One suruene aim pervales all the creations of F .-that of armsinif lofty derotional feeling through the contemplation of the beautiful in art.

FIFE, an ancient wind-instrument of military music, in which the melaly is producel hy howing throwth a hole in a reel or tube, while the escape of an is regulated by the fingers stopming or operning a number of other holes in difterent parts of the pipe. It has a emprass of two octaves, from D on the fourth line of the treble clef to I) above in altissinn. The fife figures in the seulptured memorials of the Areonautic cepolition, and from that time to this has maintained its flace as a simple yet effective instrument for martial purprises. It was common with Euglish tron ps till tho reign of James 1., but was theu discontinued; to be re-introndaced by the Duke of Cumberland at the sice of Matestricht in $1 / 27$. It is a muiversal fasourite in the navy, and many a stirring air on drums aml lifes has ehevred the British sailor to deeds of daring.

In the infantry, there is a fifer to each company, and a fife-maior to each battalion, the furmer receiving the daily fay of $1 s$. $\mathbf{I} / l$, the latter, who is a non-commissioned ofticer, $a_{s}$.

FIFE-NESS, a promontory of Sootlant, the eastmost Ioint of Fif eshire, in lat. $56^{\circ} 17^{-1}$ N... ant lone $0^{2} 3 \bar{o}^{\prime} \mathrm{W}$. On the north, in the sea, are the dangerms Carr Rocks, with an mon beacon 3.5 feet high, which required six years to construct. F is in view of the Isle of May and Bell linck lights. In the Ness, trap rocks jut through the carbonifurons strata, ant the rocks contain small caves.

## Filment. See Hazel.

FILE, FILING. A file is a stecl tool, having its surface covered with teeth or saratures, am used for cutting down and shaping metals and wther bard smbstances. There is little doubt that in the carliest stages of metal-working, when bronze inplements tirst superseleat those of stone, rouch stunes were used for the purposes to which tiles are now applied; nevertheless, the use of files tates from bigh antiquity. They are mentioned in the Old Testament in the dirst book of samuel, xiii. 21 , also in the Cdyses?

Files are male of almost every conceivalle shape, to suit the very varied purposes to which they are applied-flat, syuare, round or rat-tail, triangular, half-round, feather-edged, \&e., besites being variously bunt, in order to get at intrieate work. Nearly all these files are male thicker in the middle, or 'bellied,' the object of which will he explained under Filing.
Files require to be manle of the very hest steel, Which is first forged into the required shape, and is then called a 'blank.' The lilanks are theni finished more aecurately to the recuired form by grinding, planing, or tiling.
The blanks thes prepard and well softened (see Thafming) are next handed to the cutter, who sits astride on a low bench or stool, and has before him a stone anvil, with a flat piece of pewter laid upon it. The blank is held upon the anvil, with its tang towards the cutter, by means of a long loop of leather-strap, into which the catter plaees
his foot. He then eats the teeth lyy striking with a hamuner a short stont chisel, held oldiquely at an angle of about $12^{\circ}$ ur 14 from the perpendicular. The oljoect of this will le asily wherstoon; for, if the ehise wore perpendicular. a furrow like the letter $V$ would 1 imbented, and an equal harr struck up on each side; lont, instead of this, a cutting tooth like that of a sall, but with loss ablignty, is requiral ; this is effected by the obliquity of the ebisel, and a hur is thrown mon one side only-viz. towarts the ting.

The astonishines refularity "haserable in the distance lectween the tecth is secured in this way: The entting is eommoncerl at the $p^{n i n t}$ of the tile ; the chisel is then drawn hackwaris, laid umon the blank, and shid forwards till it reaches the hurr raised hy the last cut; the how is now strucli, and another tooth and bur ${ }^{\text {moreduced, whele serves }}$ as a guile for the next cut; and so on. 'Jhe distance lretween the tecth thas deperdes on the force of the hlow and the ohliquity of the cat: for the beavier the low, the greater the ridge or lour, and the oblinuity determines the distance of the cut frum the burr ; the skill of the workman consists, therefore, in the prerise regulation of the hlows.

Most files are doulhe cut-that is, they have two series of courses of chisel-cuts, which are oppositely inclined at an angle of ahout $55^{\circ}$ to the central line of the tile. The secomb rourse is made in the sane manex as the first, lat with lighter llows, and is usually somewhat finer than the first. This angular cronsing converts the ridges into pointed tecth. Files used fur soft metals which are liable to clos the teeth, are single cut-that is, they have lat one course of cuts. Tajer files have the teeth himer tuwarls the point. Iiasps for wool are cut with pinterl chisels; each tooth being an angular pit with a strong burr, insteal of a long furow. The newly cut teeth in the soft steel are presurved from injury by being laid npw the softer pewter block befure referred to. The rapidity with which the blows are struck varies with the fineness of the file: 60 or 80 ents are commonly made per ninute.

Files hare to he very earefnlly hardened and tempered. If heated tion strongly, or made too hard, the steel is so luittle that the tecth tear off; if too soft, they wear down rapidy, and the file soon becomes useless. Great care is also required in keeping them straight, as the sudden conling meces. sary for hardening is very apt to warp the steel.

At first slyht, it would appear, from the simplicity and continual repetition of the movements required in file-cutting, and tho preision and regularity of the work, that it is an operation specially adaited for machinery. Many attempts have been made to cut tiles by machinery, but with only partial snccess; the ehief difinculty arises from the necessity of modifying the force of the blow to suit the hardness of the steel. It is practically impossilile to supply a large number of blanks all of exactly the same bardness; and if the machine be aljusted to suit the harduess of one llank, it may strike too beary or ton light a blow for the next; whereas the workman jects at once the hardness of the steel he is working upon, and adjusts his hows accordingly.

Filivg, - To the uninitiated, this may scun a simple operation of rubbing one piece of metal npon another, and requirins only muscular strength amt no skill. This is far from being the case, for a skilful workman will, in a given time, with a given amount of musenlar work, cut away a far greater quantity of metal with a dile than one who is unskilful, for he makes every toath cut into the work, instead of rutbing over it. To do this, he must adapt the pressure and velocity of motion of the file to the coarseness of its teeth, and the barduess,

 is sumpended in a lipgin! in which it is insuluble, it may be separatel ly varims means. lubler the aticle Fixise, varinus methens if exasing such suspombel matter to collect towe thar aml sink to the lantom ir that on the surface ame therely elearing the ligum, are hascribud. The 1 rocess of filtration consist o in masims the liumal through some: furnus sulstance, the interstices of which are tor surall to ahmit of the passage of the solid 1 wo ticles, the principle of the antion being the same as that of a whe be: but as the gartichos if thaids are immeasurably small, the fores must be extremely suinute:
One of the simplent forms of filter is that ermmunly usel in chemical labomatorics for separating precipitates, de. A sprare ur circular piece of Trloting parir is foldell in fone, the comer where the four tolds meet is phacel downwards in a funnel, anl one side is purtly a lining to the funiel. The liduid presses through the 1 wes of the Iaper, and the solid matter rests uron it. The chicf alvantages of this filter are its simplicity, and the case with which the solid matter may be remosed and examinel.
i simple water-tilter for domestic purposes is sometimes male ly stuting a piece of sponge in the lottom of a fundel ur the hole of a Howerpot, and then placing above this a laver of pebbles, then a Laye of coarse sanl, and ahowe this a laver of panded charcoal three or four inches in depth. Another layer ai pehbles should be phaced aluve the charenil, to prevent it from being stimel up When the water is poured in. It is chvious that such a filter will reguire eceasional eleaning, as the saspoded impurities are luft behind on the charcoal, \& \& This is lest dome ly remewing the charcoal, \&c., and taking wat the sponge and washing it., by a small addition to this, a cottage-filter may, he male, which, for practical use, is quite equal to the must expensive filtors of corresponding size. It consists of two thow cr-pots, oue aloove the other; the lower one is fitted with the sponge and tiltering layers above described, and the upier one with a sponge onls: The mprer pot shoulat loe the largest, and if the lower one is strong, the uper ine may stanl in it, or a piece of wond with a folle to receive the uprer pot may rest nfon the rim of the lower one. The two pots thus arranged are paced upon a three-legred stool with a hole in it, throngh which the projecting part of the lower gupe passes, and the water Irups into a jur luaced betiw. The upper yot serves as a reservor, and its sponge stops the consser impuritics, and thus the filterins layors of the lower une may be used for two wr three years withont being rencwer, if the uper sumpe be oreasmally deaned. Care must be taken to wempe the undre songe tightly conogh, to prevent the water passing fromi the ulper pot more rapidly than it cin filter through the lower one.
A great varicty of filters are mate on a similar principle to the abow, lut constructed of ormamental earthenware or porcolian vessels of suitable shape. It would occupy too much space to criter upon the merits of the diltors of different makers, especially as there is really bry lithe differace betwern them in point of ellicionsy, and nearly all
the drmertic filters that arp offered for sale are wedl andipted for their required prarpose. In jurChamin a filter, the buyer must not be satistien with merely seeing that the water which has pusel thrmigh it is rembered perfectly transparent -this is sn asily chne by a mew and clean tilterhat le should see that the tilter is so constructed as to admit of leing readily eleansed, for the residual mattrer must lodge smmewhere, and must he somehow removed. When large quantities of water have tot te tiltered, this beomes a serions dillientty, and many ingomous mokes of oreromans it have been in rised. In most of these, water is inale to cacend through the tiltering mediam, in oriler that the impmrities collected on it may fall lack into the impure water. lelowe's ascending filter consists of four comparments, one alove the other; the mper part, containing the impure water, is cqual in capmoity to the other three. This communicates by a tuhe with the lower one. which is of small hright. The tap of this is formed liy a piece of bormas filtering-stone, through which alone the water can lass into the third compartment, which is tilled with charcoal, and covered with another plate uf porms stone. The fourth compartment. immediately above the third, receives the filterel water, which has lwen forced through the lower stone, the charcoal, and the mper stone. A tap is athixed to this, to draw off the filtered water, and a plug to the sceond or lower compartment, to remose the sediment.

In the diagram shewing this filter in section, the figures $1,2,3$, and 4 indieate the errresponding comparments. At $f$, the tin, uf the tube liy which the first and scoond ermpratments communicate, a

Leloge's Filter:

1. o, 3, 4, the four compartments: $a b$, the first porous stone of third or filtering compartment; $c d$, the exit filtering stone of al $f$, the plug to remove fir cleaning out secoml compartment; $f$, a loose sponge at entrance of communicating tube.
sponge may be placed to stop some of the grosser impurities.

Since 1831, when this filter was contrived, a number of ascending filters have been patented. many of them being merely tritling modifieations of this. Bird's Syphon Filter is a cylindrical pewter wessel containing the filtering media, and to it is attached a long cuil of thexible pewter pipe. When used, the eylinder is immersed in the water-lutt or eistern, and the pince uncoiled and hent over the edge of the eistern, ind hrought down considerally below the level of the water. It is then started lyy applying the month to the lower end, and sucking it till the water begins to flow, after which it contimes to do so, and kecpur a large suply of clear water. This, of course, is an ascembins filter, and the uparl pressure is propertionate to the differenes between the height of the water in the eistern aud that of the lower end of the exit tnhe. See syphos. Sterling's filtering tanks are slate cisterns diviled into eompartments, the water entering the lirst, then passing thround a coarse filter to a second, and from there through a finer filter to the main receptaele, where the filtered water is stored ant trawn off for use.
A common water-butt or cistern may be made to filtur the water it receives by the following means: Divide the cistern or butt intu two comprartments, an upper and a lower, by means of a water-tight partition or false bettom; then take a woden fox

## FILTER, FILTRATION.

or small barrel, aud perforate it closely with holes: fit a tuhe into it, reaching to ahout the midele of the insile, and projecting outside a little distance; fill the hox or larrel with powdered charenal, tightly rammed, and cover it with a bag of felt; then fit the projectines part of the tube into the mindle of the fillse lustom. It is evident that water can only fass from the apper $t_{0}$ the lower compartment ly going through the felt, the chareoal, and the tulne, and thas, if the uper part receives the supply, and the water for use is drawn from the lower part, the whole will he filteret. It is easily cleaned by removing the felt and washing it.

Sarions means of compressind earbon into solid pormas masses have been patented, and filturs are mate in which the water passes throuth blocks of this eompressed earbon. Mast of these are well adapted for the purpose, lat their asserted superiority over tilters composed of lavers of sand amb charcoal is donbtful. A very derant and conbenient portable filter for soldiers, travellers, and others who may reguire to drink fron turbid pends and rivers, was ennstructed of Ransones's fittering stone, aud is also made of the compressen earbon. A small cylinder of the stone ur earbon is comected with a flexible lindia-rubber tube in such a mamer that the cylimer may be immersed in a river, the month appiond to a month-pieec at the other end of the tube, and the watire drawn through the filtering cy-linder.

The filtration of water on a large scale will be treated of under Water-surpis.

Some very interesting experiments were make hy Mr II. M. Witt, to ascertain whether soluble matter, such as common salt, is in any degree removed from water by filtration. Theoretieally, it has bern assumed that this is impossible, since the filter uuly aets mechanically in stopping suspended partieles: but the results of Mr Witt's experinents shew that from tive to difteen per cent. of the soluble salts were separated by sand-filters such as alowe deseribed. This is a curious and interesting subjeet, well worthy of further investigation. Another most important matter, on which a serics of accurate experiments is reguiresl, is to ascertain to what cxtent soluble organie matter may be deemnonsed ly filtration, especially lyy chareand filters, and to ascertain how long chareoal and other porous matter retains its poperty of acting on organic matter in watery solution. The power of dry charconl in decomposing oryanic matter in a gaserms state is well estahlished (see below), and it is also well known that fresh ehareoal aets powerfully npon organic matter in solutions, lunt the extent to Whiel this power is rotained in the elaresal of a filter in contimums action has mot been satisfactorily ascertained. This is of the highest impertance, as it sonntimes happens that water of brilliant transpareney, and most pleasant to drink, on account of the carhonic acill it contains, is charged with such an amount of pisisums organie matter as to render its use as a daily beverase vary dangerous. Chareoal obtaned from lurning liones is still more effieacions than charemal from wool. A filter of animal charenal will render London porter enlourless. Lam and elay have similar properties. lrofessor Way found that putrid urine aul sewer-water, when passed through clay, dropmed from the filter colourless and inoffensive.

When a liguid enotains mueilaginons or other matter having viseous properties, there is eonsilerable difficulty in filtering it, as the pores of the medhum heeme filled up and marle water-tight. Special filters are therefore reguired for syrups, oils, \&er. Sueh liquids as ale, beer, \&ec., would be execedingly diffieult to filter, and therefore they are
clanifical by the fracesses deseribed under Fincom. Oil is usmally passed thenofh long bags mate of twilled cotton cloth (Cominn flamel). These are commonly 4 to 8 feet long, molle to 1.5 inches in diameter, and are enclosed in eonrse envas hase, $S$ or 10 iaches in diameter, aml thus the immer filtering-hag is corrugated wr erensed, and a lame surface in proportion tu ita size is thas presentect. Syrups are filtered on a small seale ley momfectioners, Ne., ly passing them through concicil flanne lags, and on a large seale in the coucses betg-itter just deseribet. Thick symups have to be diluted or clarified with white of equ, to collent the sediment into masses, and then they may be filtured throurh a coarse eloth strainer. Fegetable juices gen-raily require to les treated in this manoer.
The simple libloratory filter has to be monlified when strong acid or alkaline solutions, or sub. stanes which are deompused ly organ mattor. require filtration. Phre silicions sand, a blus of asbestros, phumbed glass, or elean chareoal, are bed for this purpose. ljattger recommonds gun-cotton as a tilter for such prousus. He has used it for concentratell nitric: acid, fuminds sul!hurie aciel, chromic acill, fermansanate of putash, and concentrated solntions of futash and aquar regia. Nas suys that properly prepared gun-coteon is only attacked at ordinary tumperatures hy acotic ether.

Filtering pajer for haboratory burpeses requires to be freed from inorquale impurities that are sebuble in aceils, \&e. ; this is whecten ly washmo the par with hivdrochloric acin, or, when thick, with nitrie anic ligetrochloric acil, and removing the acin by washing thoronghly with distilled water.

When a consideralde ghanfity of liquid hais to priss through a filter, it is sommtimes lesirable that it shoulil le made to feal itself. In the laturatory, this is done liy inverting a flask filled with the liquil wer the filterin:funcl, the month of the flask just touchine the surface of the liguid when at the resired height in the frumel. As som
 as it sinks below this, air enters the flask, amb some liguid falls into the fumel. On a large scale, self-acting filters are fed by the common contrivance of a hall-eock and sumply pipe.

A ir fitton,-The extrandinary powers of chareonl in disinfecting the gaseons prodnets evolved from decomposing animal and wigtable matter, have bem mado available hy In Stenhouse in eonstructing an apmatus for prifying air that is made to pass through it. A suitable eage, containing charconal in small fragments, is fitted to the olening from which the deleterious gases issuc, and is fommit to render them 1 erriectly inodorons, and probably immenus. The first application of this was made in 185t, when a charenal air-filter was fitted up in the justice-ronm of the Mansion House, London, the window of which opens above a large urinal, the smell of which was very uffensive in the room. The filter at oner distroyed the misanee, and 'although six years have elapsen, the eharom has never required to be renewed.' $10: 3$ of such filters have been applied to the outlets of the severs of one district of the eity of Lombon, and no bad smell is obscrvable where they are placed, aml no obstruetion offered to the ventilation of the sewers. Thay have been applied with like results in two or thrue conuty towns. The subject is fully treated ly 1 )r

FINE OF LANDS, in Linghol. fotitions frum ceedings fomerly in commen nas in orler to tranafor or secure real property ly a mon mon ditacious than an ordinary comberane. If firse is detinat by
 tion anit timal arement hy lewe ant heme of the king or his justiciarics; and such inded it was in its origimal ehtert and it was called a fine lecanse it phat a termination (finio) to all litigation lutwen the parties, and thase daming thengh them, in ratere to all maters tumberg the suit. The proweding in a fine were shantly as finluw: The garty to, whom the lan! was to lec convegel eommencel at fectitious suit aqainst the vember. Fint the case was no somer in court than the plaintifi askod leawe to aume ur settle with the defolant. This leave having leen Whtaned. a cowemant was enterel into whereby the semer or defemlant, called the romizar, recosuised the right of the phantif, called the romizo. the the lames, of which he admitted that the phantill was wrongfully keld from the possession. These furncechings, which at first were real, were afterwands alopted universally without havines a shamw of foundation in fact. This solemm fare having luen completed, a note of the fine, heing an abstiact of the cormant, the names of the partics, and the parcels of the lam, was entered on the rolls of the cont : and the lusiness was concludolloy what was called the fort of the fine, setting finth the parties, the time aml place of agrement, and lefore whom the line was levied. The whole was cmbertied in indentures eommencing her est finalis romeorlias. It Was theessary that a fine shoud be levied openly in the Cont of Common Il as, or befone the chiefjustice of that court, ar lefore two or mone cummissioners appuinted in the equntry: Fimes were of fom kinds, which neel not be specified hore. In order that a him shomb have full etticet. it required to be lesied with prablenmetions, i. e., "lun proclamation of the transaction in court. A the sur livita] cut of the right even of strangers whe failed to assert their cham daring the perion allowed hy haw; hence an estate was satid to low hareel loy fine and non-claim. A tine levied by a marriod woman hat the effect of cutting off all rieht she might have in the lamds. and was the only mole by which a maried woman could conver lamds and in urder to botect her from undue intlience, she was privately cxamined as to the voluntary nature of the transantion. A fine leviel by tomat in tail whe of the ustate tail, but did not allect remanders; hence, thmeh a tine was sumetimes used to bar an entail, the hand methol was bermmon Secosery (1]. w.). bint while a recosery was the most eflectual methon of larring an entail, it required the consent of the tenant in possession. Where, then, that consent could not be ohtained, or where the tenant in tail was at the same time tenant in fece in romander, a
fine was a conmonat monde of larrime the entat. The statute $I_{0}[$ momis frohibitul tines as a means of barving entails, lut this restriction was removed by $32 \mathrm{Hen}$.VIII с. 3 。

The ohd law as to fines has heen almbished by
 Thin out was passed for the purporo of abolishing the cmabrons machamery hed in the transiop of land acording to the ancient forms and firetions. The act almbishes all the fictims fommery in and
 it pernits every tenant in tal if frembld lamel
 tor diopose of the lamds for an cotato of ife-simple alsulnte, on any less estate, ly any of the orlinary combrynces, exeft a will, at commma law, or under the statute of Ises (i. . 5 ). The converance must be registeren in the ['nart of 'lanacery within six months after its execntion. Lut wheme there is an estate of freelnh prior to the estate tail, the act remines that the ennsent of the tenat of the frece hond shall he neensary in order to give full effeet to the conserance. This jersom is calle l the potentor ti the settlement. Whore a emseyance is wade withont consent of the porector, it has the effect of
 heir loy whom it is a cereded. This is precisely the edfect which manor the ohd law hedongen to a recivery withont the consent of the temant to the parerime and of a lime loviel low a trmant in tail: si that the statutc, while it aboblishes the fictions, sustains entails is femmly settlements to the limited affect whinh they formerty possesed. In regarl to dines bemornol women, the act proviles that at feme
 of money sulject tolne investen in the jurchase of lands. It is nevessiry, unless specially dispensed with by the chart, that her mashand shombl comenr in the converanee, and that sh. shman acknowlatice it before a judie of une of the supuriow comrts at Westminster, or a Alaster in Chanedry or two of the rommissioners apponted for that furpose under the act.

during this prion ly surmonting the finial with a pilded vane. This is common in T'udor and domestic architecture (fis. 3). Fimals were carval lowth in stone and woml, and in the latter material with great delicury and minnteness. In connection with motal-work. fimals of metal were used. and whatever the material mingted, its natural capabilities were male a somree of special heanty.
The tinial is one of the most effective onaments of Ginthic architecture, and when that style was sncected ly the revial of classic, in the reign of Gneen Elizabeth, our forefathers coull not persuade themselves to fart with the fimials to their lmildings. We thus find in Lilizalocthan architecture a great varicty of fimials; they are, however almost entarely of in geometric form, and without foliage (tize 4), and are frequatly, especially when terminatine wooden \&atles, combinations of finial and vane partly wood aml partly irm (fiq. 5). In the stricter classic which suceende-l the Elizabethan, some traces of the fawnate timal still remain in the lalls, ohelisks, \&e., nsed as terminations, amb also in the shichets and supporters (themorlves a remmant of foutalism) which form the ernwing omannent of gate-piers, pedestals. ite.
 surh as lecer, wine, N: Thu simplest monde of fining is by passmp the higur through a pormo sulistance that motans the solids and allows the clear liquil to pass through (sec liumen); luat this methal is only applicable to particles menanically suspended in a limpud liquid. When the havid rontans macilarinons or other matter, that readily clors the filter, some other mans of tining mast be used. Such is the colse with all mate liguors and most wines when turbin!. When in quol comblition, these do nat usually require fining, as the suspenicil matter aqghomerates, and sinks to the bottom shortly after the fermentation is completal. When this
ducs but take pare. sume mans of pronoting sumb action are nsuatly adopoted. One of the simplest is to, ard soluble albmond, such as white of eqge to a portion of the luniul, and after beating it well in fhis. tallal the mixture, :and stir it into the whale if the liguil. El"m the application of hat, the athan a coagulates aml contrats from its liffusion mote : semm, ervelophy and drawing togethe the snepembed mater. Tho seum is then pasily removed. This methon is adepted for syrups ant athor liquids that may be beated without mischief. In making Wear smids, the all mane of the meat performs this functand. As alcohol conaruates allmmen, it may he used for fiming wines and cordmals without the appheation of luat. It is emorally nesed for red wincs. Malt hipurs are nsially fine ly means of gelatine, either isinelass on chaper sulnstitutes hemg insed. One poumd of isinutass is soaked in three or four pints of wathr, or some hax, then more sour liguor added as tho isinghes swath, until it amomes to about agallon. 'l'lie folly thas formed is next dissolved in seren or equit galloms of the liquor to he fined. Thiss sulution, having the consistence of a syrup', is called '1 hewers' hamos,' and about a pint to a pint and a half is added tor a larrel of ale or porter, or to a hurshead of chler or winc. The action of this selemis unn the combmation of the gelatime with the astrinemt matter (tamic acid) of the lignor, forming therely an insoluhte solid, which sinks to the bettom, and carries with it, like the coagulating almmen. the suspended matter; but as the Havour of malt liquors partly depends uron the astringents they vitain, the thing allects the thavour : the astringints also help to preserve the liguor, and hone their removal is in this respect disadrantageons. Malt lijuors thus fined do not 'stand well on draught.' 'The use of gelatine for fining red wines is objectionable, as in most of these the astringent Havom is an esteemed quality; and therefore albumen is preferred.

Other methenls of fining are adopted. Sugar of lead is sometimes ahbel, aind afterwards one-lialf its Weight of sulphate of jutawh dissolved in water. By this means, an insmble sulphate of lead is precinitatel, which in subsiding earries down other matters with it. This is a dagerous process, the salts of laul beins $l^{\text {wiswnons. If properly conducted, }}$ the whole of the leal may be preipitated, but a casual mistake in the quantities minht canse the death of many people. Ox-blook is used in the same mamur as altumen and isinglass. Lime, alum, alcohol, and acils act by congulating allomen \&e, contamed in the ligumr. Plaster of P'aris, elay, and evon sand, are sometimes used to carry down the suspended matters. A strip, of isingliss or a pieee of dricd sole-skin is often used for fuing collice, and it acts in the manuer above deseribed. Limuors that are unasmally difficult to fine are called'stublorn' by coopres and vellarmen.

FINISTERE, or FLNBTELIRE (Lat. Fins terre, "Lamd's End"), a department at the western extremity of France, comprehomdine a part of the former duchy of Bretagne, has an area of ehts square miles, amb a population of 602, 45. . It is trabersen from cast to west by two low lint ficturespuc chains of hills. Its coast is very rugged and broken, its shores bristling with dangerons granite rocks, and frinced with many islamels. The soil, one-third of Whoh is occupnol ly sandy tracts ammarshes, is molcrathly prodnctive; and, nwing to the vicinity if the se:l, which washes the northern, west.rn, and sonthorn shores of the department, the climate is mild and humid. Corn, hemp, and lax are grown in considerable quantities. In the valleys, smiling matows ercrywhere occur. The silvor and lead mincs of F are very valable; those of Pouillamen

## FISISTERIREFINLAI.

and Huelget buing alout the rieloest in France. Its principal rivers are the Aulne, the Elorn, and the Odet. The first of these is ennnected by a canal with the Blavet, and forms part of the great line of communication ly water from Brest to, Nantes. This department is divided into the following five arronlissements: Quimper, Lrest. Chateanin, Morlaix, and Quimperle. Quimper is the ehief town.

FiNtsterre, Cafe, or LANDS END, is the name given to a promontory at the north-western extremity of Spain, in lat. t? $54^{\prime} \mathrm{N}_{-}$, and Jong. about $9^{\circ}$ פ1 $\mathbf{W}^{\prime \prime}$. It is the Promontorium Jireme of the ancients.

FINLAND (Fin. Summesimea, land of lakes and marshes) is a grand duchy of Linssia, lymy hetween 59 and $70^{\circ} \mathrm{N}$. lat., and letween $21^{\circ}$ and $: 3$ long., is about 7.0 miles from north to south, and lans an average lreath of abont 18.5 miles. Aceoriting to the liussian census of 1851, the pupulation was $1,626,915$, and it has maintained a prette con-
 The area of F. may be estimated at about 13:3,000 square miles, of which nearly one-thirit is ocenpieal by marshes and lakes. The larest of these sheets of water, imiepemently of Lake Ladoga, whel belongs martly to the Iiussian province of Olonetz, are Lakes I'uruvesi. I'ayane, Bnara, and Saima; the last of these, which is ahont $18^{\circ}$ miles in length, constitutes a furtion of the system of water-eommmieation which has been establishel between the central parts of the comentry and the Gulf of Finland. The lakes are especially numerous in the sonth-west of F., where they are almost all united together ly rivers and waterfalls, round the centrat lake of l'yhijarri. The surface is a table-land, from 400 to 600 feet aluse the luvel of the sea, with oceasional higher wevations. There are, however, no momatain-rances, and bence the rivers are unimportant; lat in the north the country is intersected by a sandy rifge lnown as the 'Manselkae.' which merges, under the nams of the Lapintunturit Mountains, into the great LaploSorwegian Alpine chain. The coast-line is generally low, but to the south it is skirted by numerms rocky islands, selarated from the lamd by narow channels, litfieult of navigation, but well adapted for purposes of lefence against bostile attaeks from the sua. The principal genogical formations are friahle granite, harul homestone, aul slate. The forests of $F$. are still bory abundant, althongh they have been recklessly cut down in many parts of the comentry for the sak of their ashos, which are used to stimnlate the sini, whose natural poverty requires to be connteracted ly frequent manuring. l'ine and fir predminate, but lirch, beech, oak, \&e., thrive in the sonth parts of the eountry, where some good pasture-land is t" be met with. Since the incorporation of F. with Lussia, agrieulture has declined, and tishing and eattle-breeding increased in inportance. The most waluable exports of F. are however, the prolucts of its forests, as timber, pitch, potash, tar, and rosin, for although it still yiells some grain, the supply is seareely sreater than the home demand. although, when it lesungel to the Swedish crown, F. was rugarded as the granary of Sweden for barley and rye. Wheat and uats are lout little trown. Few fruits ripen except hardy lerries; and in the extreme north, vegetation is almost limital to musses and liverworts. F. yields some copper, iron, lime, and slate, but it proluces searcely any salt, which constitutes one of the principal artieles of import. lieindeer, wolves, elks, beavers, and rarions kinus of game abound; while the numerous lakes, and the adjacent gulfs, sujply the inhabitants with
an abmitance of salmon, herring, anl wther tish. The climate is rigrous, and winter, which lasts seven or eight months, is succecdel by a bricf spings which passes almust suddenly into a short but hot summer of six or seven ireeks, succeerlat in its turn hy a raing season, which ushers in the return of coll weather. In the north, the sun is absent during a part of December and Jannary, and almost perpetually aloue the horizon during the short smmmer. F. is divited minto eight lanes or govermments-Ayland, tho-Biomehorg, Tawastchuns, Wiborc, Kupio, Lit Dichel, Wasa, I leaborys, which are inchuted in the three dinceses uf Abo, borgo and Kucplo, and contain in all \$14 parishes. The predominant form of religion is the 1atheran, but the Greek Chureh has of late yars buen gaining gromml. The eourts of law are held at Aho (the aucient capital), Wasa, and Wibors: and there is one university, which was fomoterl in 1640 at Abo, hint removed from thence to the iresent eapital, 11 elsingfore, in 182!. The highest alministrative authority is resten in the imperial senate for F ., consisting of 18 members, nominated by the emperor, and presided over by the governorseneral of $F$. The army numbers now only figa men, but has the mivilege of serving in listinet carpe, without behis incorperated in the general furees of the empire. The naval force also forms a distiuct symulron, muler its own national thag.

The moly history of F. is shrouded in uliseurity, and little is kamo of the pople thefore the 1 ath e , when Eric the Saint, king of Sweden, exasperated by their piratical inrouls, mulurtook a crusale against them, and compelled them, hy furce of arms, to profess Christianity. The hoh which the Swedes then aequired over the country was never wholly lust till 1819, when Swenen secured peace with Ihussia by the cession of all F . and the island of Hand; before that time, however, the liussians hail at various epochs wrested portions of the Pimmish territories from the Swedes, while F . had beon for centuries the perchtual cause and scene of wars between the two nations. The Swelish languag. had taken such decer root in F., that the efforts of the Russian govermment to displace it in fawour of the native Fimnish have litherto met with only partial sucess, and in many parts of the country, the people still "penly prefer their oll masters. The inbalitants, who call themselves sumome and are denominated Toshules by the linssians, have, however, no athinity of race with the swoles, and may be regardal as differing from all other European nations, exceptinet the Lapps and the Fimmarkers, to whon they are very probably allied. sue Finas and Finslish Litefaticee.- For further information, see (rerschan, I ersuch ciner Cesch. F'inlard (1521); Itiihs, Finleme (Stockh. 1827); Friis, Beskrivelse orer te norake Finlapper (1st1); Gylden, Misior: och situtis.  i. 1. Kunde c: liuss'en l. Tenstrom i Fustronedokl 1/b. (ILclsinge.)

FINNS, gempaphicalive the name of the inlarlitants of Finlanal; lout in cthnologs that of a comsilerable branch of the Uerian race, dwelling for the most part in Finlam, though with some representatives in Sweden and Norway as well. The I mians have been classed amone the nations satil to have a Nomselian origin. Ir Latham places them amone the ' Turaman Altaie Nomsolida,' and diviles them into Cismans of the East, imd Cirvans of the West. The Western Lirians eonsist of Lapps. Fims. Perminns, and other nations or tribus in the morth and north-west of linssia, and of the Magyars in Hungry. The Masyars are the most numerous, and next after these cone the finns, emprising about 2000,000 of indiviluals. All the other tribes of Western IErians do mot togethor comprise so many. The $l^{\prime}$. in common with the other Cerrians, are of the Mongolian type. A reent traveller, DIr Bayad Tayb, deseribes them as haviner hith cheek-homes, square, strome jaws, full, yet timm lips, low hroad forelleats, dark eves and hair, and a lecper, warmer red on the ehedes than on those of the rosy swedes. The average h.ight is, perhaps, nut quite equal to that of the hattar race, hut in physical vicmur there is no
informity. and thore are anome thom many men infrionity, and there are anoms tham many men of splemid statnre, strensth, and propurtion.' "ther travellers hear similar testimony to the
 if jure Fimish houl; lut althongh these form the
majnity, there are many, in the towns esperially, who pass tor ${ }^{\circ}$.. while in reality, they are quite as much entitlef to the called nwertes or even linssians, on acemont of the frequent intormarriages of the F. with indiviluals of those two nations. The $F$., from having been orisinally a mome lir rame have fin many centuries heen stationary and "ivilised. Lome latore the arrival of the ferman and havic nations in the morth of Finrure, the lervims, or offres. (fire the name so commom in tiction is really of historic migin) porsessed it, aml were erahially phasel further north and east ly the new invalers.
 arigimally extomited much further south than they
 Sweden and Korway. The Fimm, says I'rochard, 'wore, in the time of Tacitns, as sitvace as the Layls: lat the former, huring the sucembing anere, hecame su far civilised as tu exthange a monntie life for one of acricultural pursuits; while the Lapls have ever comomel to be harlarous nomades, as well as the Siberian tribes of the same
 as well its their brethren the Bermahs, ir lime of the Whitc Sea, hat probably umiersone this chance Inne lefore the time when they were risited ly Otther, the cunst of Alfrem. When the Finns were anduresel by the swedes. they had ling lown a sadtled $p^{\text {rophe, }}$ lut one of earinus, and singular, and isntated character.'

The Fiunish languato, like that of the other Vrian nations, belongs to the Turanion family of lamenases, and bonce offers some strikime prints of resemblance to the lamgages and dialects of the 'Turks, 'Jartars, Aluggols, Jandshurians, Tumensians, and even Dagyars or Hangrims. In Finnish, the nomes are not inflectem. but an adhitional worl is required to lenote the variations of case. monlus, and sex. The prepoitions and promons are sutfixed to the worls they modify. The verls have only two tenses, 1 ast and present ; the future lower expressed by arding to the present some wom inhieating a future action or state of behor. Tavk consilets the Fimminh to be the most hamonibus of tomgues. Many hwedish, and a few Rassian winds have, of course, hecume incerporated with the lamguage, in romserpence of the sncial anul pulitical relations of the F . with those two comentrics. The 1 . uf our time are dombtess the same race as the $F^{\dagger} u n i$ of Tanitus, and the Phimmo of Stralse and I'themy, thong mot occupyins the same geoyraphical area. "Tle nomest apprazh to a name at onece orneral aml native.' says Dr Latham, "is summelainen, meaning swamp, morass, or fon perple; the term Finn and Fiulamer loing of foreign oricin. With respect the sucial hahits, morals, and manners if the F., all travellers are unamimons in prasing them. They are of a cheerful disposition, affectionate towards each othor, and honest and homourable in their thalimes with straugers. They are also clemly in their persons, buing much ablicterl to the nse of the vajumebath, to which circumstance may le attributed the strangly marked ditlerence in physical arpearance between them and the stunted Lapus, to whom, in lannuace as well as many wher respuets, they stand elosely relaterl.
FINS (allied to Lat. piono "r pemen, see letter F), organs adithend for swimming ir lommotion in water. The limits of the applieation of the term are rather vimo. It is always applied to the lovematise aruans of tishes, when ther lossess special organs of locomotion, as almost all of them do: ambl equally to those organs (the pectoral and ventral fins) which are homologans to the limbs of ethur verthrate anmals and to those (the vertical tins) whieh may be said to be surer-
allowl to them, ami to lolones to fixhes alone; "qually alsu to these whinh are furnishel with rays, having a membrane stretcleel on them, as is senerally the case is all the thes of fishes, and to those which monsist, ats in some tislus, of a mere fohd of the slin, and which. when they exist in tishos, are in reality mot very much insems of locomotion. The name tins is diven to the locmon tive orems of Cffeco, hat not to those of any other Mummelia. even when. as in the tase of tho hind foct of seals, they appowh vary marly to the character of the fins of ti-hos. Nor is it wor given th the wehbed feet of hirels. Pint it is Fiten given to the swimming nugns of inverteGrate animals, as to the expansions of the manthe which serve this purpose in the Cidhenembe, and which are antirely destituse of rays.

FlNEBLRY, or FEN TOWN, a parlimmatary brouth of Diducsex, forming the burth part in Lometon (II. wi).

## 

FI'NSTERAA'RIIORN, the highest peal: of the bermese Alda. See dles.

FINSTERWALIE, a small town of lrusma, in the $p^{\text {mowince of Brandembug, is situated on an }}$ athont of the Black Elster, 40 miles morth of brealen. It has manufactures of cloth amb machiney ; spinning and weaving are carrich on.

## FIORIN. See Bent Grase.

FIR, a name often usel in a sense co-extensive with the willest sense fif the word I'INe (I. . . . ) , and therefore so as to inclute a larse portion ui the Coxifere ( $4 . \times$ ), "r at least the while of the Limmean gems Pinus. Fint the name fir is often also used in a more restricted signification, and the trees so denignated are those forming the gemes Aldes of sume anthora, flies and Piove of others, which the greater number of botanists have now asreed in separatine from Pims. The siotur Fire, however, is a true Pine (Pimus soltestris), and will leaseribel along with its congeners. See I'res.The senus thies is distinguishol irnm Pinus hy the that rommied apex of the scales of its concs, anil by leaves not in chasters of definite mminer. Sone lontanists include the species of Lamen (if.r.) amb Cumpe (II. v.) in the gemus flbis: l but it these lie semated, nu speeies with clustered leaves reman in this crenus, which then emanam only the dherent linds if sprece Fie and of Silume Fin: or spocies most nearly allied to thase which ordinarily bear these names. All of them are ever--reen. Th, Spruce Firs form the gemis Alvis. in smme anthrs, distimenished by shont solitary leaves, scattered all round the branchets, aml ly the scales of the (pembluses) cones locing attemated at the apex, and remaining fixed to thr axis of the ane. The Silver Firs form the genus Picu of some, distinguisher liy the decidunis seales of the (erect) cones. It beinst sulphsed, however, that the Limmen names hail 1 een given through mistake. and that the common silver Fir is the tine. Aliess of the ancients. and the Sorway Spruce their Picen, Link has attempitent, lout withent being fullowed hy many, to restore these names to their ancient use, and to denminate the sencra acoordingly. -The Nowns crperce (Ahies earetse or Pimns Ahes) is a mothe tree, smmetimes attaining the beight of 150 fert. with lons eylimlacal pentulous cones, dentionlate seales, aml scattered, freen, crowdel, sublenly pointer, almost rualrangular leaves. It is the Fibhto of the fermans, called also Rothtane or solkeretonne. Like the other kimels buth of spruce and silser Fir, it exhibits the peculiar cbaracter true Bines ik, in its perbectly crect sumbe frum when promed abone whorled homantal hanches.

 Cupled frem selby's Brilish Furcst Irres
It is a very buantiful pramidal tree and when oht, it hog lrambes drom towarts the gromul. It finns entire firests in the middle aml nath of Surphe and in Asia, chietly upon elevaten ridges, althengh it prefers moist phaces. It luves districts of primitive rims. In some places, it is fomm wen within the Arctic Circle. It is not a mative of britain, Iut han lung been very generally phatea, although tow wifto it is merely made a nurse for other trees, and is not allowed to attain a considerable ate or size. It is of raphe growth, hot is bulicvel to live to the age of 410 years. It yields

Cone of Norway sprace Fir:
$a$, branchlet and cone; $b$, scale, with seeds; $c, a$ secel.
the same 1 whants as the Seotel, Fir, resin, turpenturn, tar, ath lamplaich (see these beads) : hat mon r-sin than turnatine. The true Brace limin flows puntinemsly from the bark. The purest phens are whish or pake yellow, are sold under the
 (mathonta anl plasters, aml when melted yiell the comman liurgunly l'itch (in. v.). The bark of the spmee is a ghed and cheap non-combuctor of heat:
tha coms are an excellent substitute for tammers bark. la sweden amd Korway, the inmer lank is mand intobments annl the lonig and slember ronts, split and huiled with alkali amil seat-salt, are elrien, ant twistend inter corlare which is nsed boith for vosis lo and hy formers. 'The woul is usel for fucl amb for homerbuhling : it atso supplens masts and spars tur shijes. It is the Whate ('messmana bian. and Daxat 1hen of the maket, and in wery laroly inaurted into britain from Nowsay and the laltir. It is whiter, leghter, hess wimms, and more elastic than the timber of Seotel Fir. 'The milwome, whilst still in a melatimons state, is swert, and is eatem
 an thees of scarcity, is mixel with is litthe flour on moal of some kink, and baked into loreat. The voung shouts, still covered with their hal-seales, are in mimy parts of Earape nsel for funigation. The leaf-1mils are alsomplowed mombinally in cases of semry, rhemmatism, and gout. The pollen is often sold ly ant hecaries instead of the dust of the Clubmassur Lydoporlium. - A very suphur rariety of thes tir is known as the Reb Nobway trebere bward burieties are cultivated ammest ornammatal shrubs. -The linath sifuce (Alites miprot), of which the
 an a more varicty cansed by difference of soil, ant the Winte sipleve (A. allut), form great woods in North America. The black sprnce is fond as far north ns lat. $65^{\circ}$. Buth suecies are now common in plantations in Eritain. Joth have qualramgular leaves; those of the black sume are of atark Haneons pren, those of the White spruce are of a liantion colonr. The cones of the Inath sprace are short, ovate-oblong, whtase, and pemalums, with wombed seales ragged at the alge: those of the White Spruce are osal, and tapring to a print with entire seales. The black suruce is a valuable timber tree, supplying yands of ships, \&e., lat its planks are apt tu split. "The White simuce is smaller, and the tmaner inferior. From the Bhack Siruce the hssence ef spruce is ontainel, which is so useful as an antiscorbutic in long royages, and is usel for making spuce-beer. Simee-ber is also mate by ablimg molasses or maple sugar to a decoction of the yomg hranchlets, and allowing the whole to ferment. From the tibres of the root of the White Spruce, maceratel in water, the conadians prepare the threwl with which they sew their lireh-bark canoes; and the seams are male water-tight with its resin. - Prom the twigs of the Orievtal Fir (A. Orientulis), a mative of the Levant, a very tine clear resin exules, which is known by the name of Sapinites' Tenis. This tir has very short quadraugular leaves, densely croweded, ame uniformly imbricated.-The Hembock Spedee of North Amerien (A. Conadensin) forms great part of the forests of Canala ant uf the Northern States of Ameriea, extending northwards as far as Hudson's Bay. Its timber is mut much estemed, as it splits very obliguely, and leeass raplly in the atmosphere; lat the bark is valued for tanning. The leaves are two-rowed, that, and obtuse. The cones are sarcely longer than the leaves. The young trees lave a very graceful alpearanee, but the ohler ones are generally much dhafigured ly remaining stumps of their lower handhes.-i. dumosa of Nepal is very much allied to the Hemlock Spruce-A. Dounlusii is a mohle tre", attaining a height of 250 fiet, which forms inmmense forests in the north-west of Ameriea, from lat. $43^{\circ}$ to lat. $52^{\circ}$. The lark, when the tree is old, is ruged, and 6-9 inches thick. It abounds in a char, yellow resin. The timher is heavy, firm, and valuable; the growth very rapil.-A. Menziesia, a mative of North California, very similar to -1. Dunglosii in general appearance, also produces
timber of excellent quality.-A. Bramoniana, a Himalayan species, forms a stately blunt pyramid of $120-150$ feet in height, with branches spreading like the cedar, and drooping gracefully on all sides. It is found only at considerable elevations. The wood is not durable, but the bark is very useful.The Khetrow or Himalayax Sphece (A.Smithiene, called also A. Morinda and A. Khutrow much resembles the Norway Spruce, hut las longer and mure pendolons banches. The wood is white, and not bighly esteemed, althourh it reanily splits int, phans.-The Mourt Evos lifi (A. Cepholunica), a native of Cephalonia, attainings a height of 60 fect, and a diameter of three feet, yidds duable and yery valuable timber.-All these specics have loen introduced into S'ritain, and shme of them seen likely soon to be pretty common in war phantations, as well as others from the north-west of Amriva aud from the momatains of $A$ sia, as $A$. Wittmennione, \&c., noble trees, and apparently quite suitable to the climate. -The common Silvere Fir (ficme pectinute, or Abies or limes pion) has erect cytindrical cones, $5-6$ inches long, and two-rowed leaves, with two white lines mon the umber side. It forms considerable wools upon the monntains of Central Europe ank of the north of Asia, aud attains a height of $150-180$ fort, and an are of 300 years. It is not a native of Iritain, but large trees are now to be seen in very many flaces. The wood is white, contains little resin, is very soft and light, and is employed for the ordinary purruses of coopers, turners, and joiners, and in ship and bouse earpentry, also for making band-hoxes and for many fine purposes, especially for the sounl-ing-boards of musical instruments. The same resinous and oily products are oltained from the Silver Fir as from the Spruce and Scatch Fir,

Silver Fir (Picea pectinata):
Copied from Sclby's British Forest Trecs.
but of superior quality. It jields the beautiful clear turpentine known as Strashurg Turpentine. Very similar to the silver Fir, bot gezerally of much smaller size, and indeed seldon nuch above thirty feet in height, is the Bala of Gilead Fir (Picea or Abies balsamea), a native of North America from Virginia to Canada. The wood is of little
value, but the tree yiehs (cavila Balsim (q.v.). Besides these, a mumber of other species of Picia are found in the western parts of North America and in the Himalaya, some of which are trees of great magnitude, and yieldiny excellent timber, as

$a$, branchlet and cones; $b$, a feale; $r$, ascu.
P. !mandis, a Californian tree of 170-200 feet in height- $I$ ' amabitis, a species much resumbling itP. nublif, a majustic tree, which forms yast ioresty on the momains of Sorthern C'aliformia- $P$. brevtuth, a Californian sucies remarkalle for its slender stem, which rises to a height of 120 feet, and rut is unly about one foot in diameter at the basp, and likewise for the mamer in which the midde. lole of each liractea of its cones is mrorluced so an to resemble a leaf-P. Webliona, the Inmaramas Silver. Fin, which, in its native regions, fills the "hper parts of mountain valleys, and crowns summits and ridges at an clovation of upwards of 10.060 fect, a tree of great size, 35 foct in girth, and with a trmak rising 40 feet before it sends ont a luanch. Mast of these have been introluced into Pritain with good prospect of their succesting well in our climate, and other species, as $P$. Pirltet, a mative of the Altai Mountains, very nearly resembling the Silver lir, $P$. Nordmamionu, $P$. Fraserii, \&c.- $P$. religiose is a tall and elegant tree, a native of the mountains of Mexico, with slender branches, which are very much used ly the Mcxicans for adorning churches, and crones slurter than those of any other Silver Fir. $P$. dsomsis is a new slecies recently introduced from lapan.
FIRDUSI, FIRDOWSI (Ttesi), Abe'l-hasme Maxsce, the greatest epic poet of lersia, was horn he tween $304-328$ in, or $916-940$ A. 1., at Shadale or Iizran, new Tus in Khorassan. Whether the nane Firdusi (from firdus, garden, paradise) was given to him because his father (Fachreddin Ahmad) was in gardener, or on account of the 'Paradise of Poctry' which he had ereated, is matter of controversy. All that is known of his early life is, that when a boy he was very industrious, and also that 'be loved to sit for days alone on the bank of a river.' At the age of between thirty and forty, he went to Gazneh, where Mahmud the Gaznewide, a great adnuirer and patron of puetry and the arts generally, then resided. Erelong, F. had an opmortunity of displaying both his taient and his extraordinary knowledge of ancient Persian listory and legendary lore before the sultan himself, who was so pleased with an episode (the story of Sijavosh) written by him at his majesty's order, that he at once praid him a gold dirhem for each couplet, and shortly afterwards sent him a great number of fragmentary ancient chronicles and histories of Persia, that he might versify them, and thas carry ont the task once attempted by Dakiki-riz., to write a poetical

## EIREARMS.

mortars, and small-arms presents itself; but in the infaney of the invention, ame amill the obseurity enshrombing it, we can only seek to inqume into the origin of firearms renerally.

The invention of gunnowder bears so directly upon the grablaal introdaction of firearms, that it will be well to consider the two diseoveries eonenrrently. The widely prevalent notion that inn powler was the imention of Friar bacon, and that camon were first used ly Eilwarl 111. uf Ligland, must le at ance discardel. It is cortain that grmporwater ditforal in no eonspicuons degree from the frede for of the Byzantiue empurors, nor from the torrontrid thumeder of Clana and ladia, where it had leen known for many conturies bofore the ehivalry of Eurone began to fall beneath its levellines power.
"Nitre,' says Sir George Stannton, 'is the natural and baily proshee of China and lndia: and there, accordingly, the knuwledge of gunpowder seems to be coeval with that of the most distant historic events.' The earlier Arab histurians call saltpetra 'Chinese snow' and 'Chmese salt;' and the most aneient records of C'hina itself shew that, when they were written, fireworks were well known, several hundred years before the fhristian era. From these aml othor circumstances, it is indu. bitalle that gmpower was used by the Chinese as an explosive compound in pre-hnstoric times; when they first discoveret or apllied its prwer as at propellant, is less easily detemminerl. There is an aceount of a bamboo tube being used, from which the 'impetuons dart' was hurled a distance of 100 feet : this was at a very early period, hut it is diffienlt to say precisely whem. It is recorded, however, that in $615 \mathrm{r} . \mathrm{c}$. during the Taing off dynasty, a camon was employed, bearing the inseription: '1 hurl deatly to the traitor, and extermination to the rehel.' 'This must ahnost neeessarily have been of metal. We have also curions evidence in regard to the armament of the Great Wall; for Captain Farish, who aceompanied Lord Nacartney's mission, reported that the soles of the cmlurasures were piereel with small holes, similar to those used in Europe for the reception of the swivels of wallpieces. The holes appear to le part of the original ennstruction of the wall, and it scems diffienlt to assign to them any other purpose than that uf resistance to the recoil of firearms.' If this surmise be correct, the use of jingalls womlul be married back to three conturies at last hefore the Christian era. Stone mortars, throwine missiles of 12 lb , to a distanee of 300 paces, are particularly mentioned as having been employed in 757 A. D. by Thane's army ; and in $1 \geq 0$ A. D., it is incontestable that the Chinese besioged in liufong-fou used cannon against their Nongol encmies. Thus, the Chmese must be allowed to have established their claim to an early practical knowledge of gumpowier amd its effects.

It seems likely, however, that the prineiples of firearms reached Europe from India rather than China, and that eountry has equal, if not superior, clams to the first aequaintance with the art. The ancient sanscrit writings appear to point very painly to the phration of sonne primitive sote of canmon, when, in recorlin: the wars of the Egyptian Horedes in India, it is stated that the sages remained unconcerned spectators of the attack on their strongholl, till an assanlt was attempted, when they repulsed it with whirlwinds and thunders, hurling destruction on the invalers ; and a Greek historian of Alexamder's campaign testifies that the Findis had the means of discharging flames and missiles on their enemies from a distance.

These Indian philosophers scem, from the writings
of Ctesias and Elian, to have also possessed an unquenchable tire similay to that employed later by the Crreels. Fassimy from these very early times, in which there is reason to leclieve that some sort of great gun was employed, we eome to the comparatively recent date, $\mathrm{I}:(0) \mathrm{A} . \mathrm{r}$. , whon their use is establishol beyome a doubt, for C'lased, the Hindu lard, writes (in stanza 257 ) that the culivers and eamons made a lood repnet when they were fired ofl, and that the noise of the ball was hearel at the distance of abont ten coss, which is more than threequarters of a mile. In lass, the vizir of the king of belhi went forth to met the ambassalur of Ilulaku, the grandson of Genghis lihan, with 3000 earriages of lirewnrks (in the sense of weatpons, prubillys a sort of rule muskets). In 1368, 家保 qun-carriaces were eaptured by Muhammed Shah Balmiani. The use of eannon had so far advanced in India by 1452 , that they were even used for naval phroses; shells having been employed two years earlier by the
 matchluckmen to contemel with, as well its heavy ordnance. ligafetta, in 15ll, foumd the town of fimmeo lefemed by 62 pieces of campon mounted on the walls. So much for the antiguity, and aprare ently conmon use of firearms in Chinit aud hidia, at times long anterealent to any knowlodge of them in burope, and duriner the perion at which they were searcely developed in an effectual degree. Mast of the pieces discasered in India, and supposed to be of early mannfacture, are composed of paralled iron hars welded together, and very often they had a mosable brech-piece.

The knowledge of gunpowiler and firearms may be fresumed to have extemided in a westerly direction throntgly the Arabs, whom we find using them possibly in $711 \mathrm{~A} . \mathrm{D}$. , unter the name of monjumike, and evatanly very early in the lith centnry: The byzantine emperor, Leo, introdncel "tire-tules" between 890 ant 911 , for use in connection with Greek fire: and there ean he bittle doubt that these were a species of cammon, polialsly of snall bore. In Spain, both Nwors and Christians used artillery as early as the loth century.

Friar Ibacon was eonspicuous among his contemporaries for his general learmin, and we lave no evidence to shew whether le discoveret the ingredients of wunpuwier independently of foregn aid, or whether he derived the knowledge from some ancient manuscripts; the latter, lowever. seems the more likely conchasion, as sir F. l'algrave lrought to light in the lumblei:n libaray a Fetter from a Spanish friar, Brother Perrarius, who was a contemporary of lacon, in which the saterials of Greek fire are cletaled, differime only in propurtions, amd in these lont slightly, from real gunpowder. That the latter was identified of old with Greek tire, is shewn by the name ' Crake, applied to the first cannon used. This worl, whieh stall survives in "eracker,' is pointed out liy sir F. I'algrave to be nothing more than a Nomman corruption of ' (irec.' Jiacon's amonncement ditos from lisl6; lut the powder of his time, as male in the West, was not readily explosive, since the materials were hut rouply eleared of impurities, and then mixed together on a slall; and pobably little use coukd be male of it as a propellant until the process of gramulating hal been introduced ly Bertholdins schwartz in 1320 . lmmediately after this dis. covery, camon of small size appented in the armoury of alnost every state, as if thein use had heen known previously, althung no practical effect had been given to the knowledge, on account of the bulness of the powder manufactured. These cannon generally consisted of a smaller barrel or chamber to receive the charge, which fitted ivto a larger
one containing the projectile (see tige 1). It may
 fram thear mance were thatahly hambess-at leant to the unomy- in their practive. la lawe the Florentine remulndenclural the making uf irm shat and cinmmin for the lefence uf its villages. [a lo:2. Lilward 1 11. used 'rakeys

Irnm the sinnm Mnuseripts. in 1832 . torn eannons were maphoyen in the siene of camlaray. By late, varinus inimovements hal loen male: and we tind in the same year the fonsuls of Brages witnessiner experiments by one I'eter, a timman, who hal constructenl a vannon witle a square lmre to throw a eubical shot ui ahout eleven poumls; his holt passed both walls uf the town, and unfortunately killeal a man on tha. other sich. We hase the atuthonty of Villani for helieving that Entward 111. hat three camon at -récy: but the cammon then manle were, from the little knowleble of casting. limited to about the sizn of molern duck-gns, and, as has been ro. marked, three very inferior muskets could have hal hut litele to do with puttingr 50,000 men to thight.

Fif to this time, European oranance bad been kept back by the rarity and high prices of sulphur, saltpetre, ani irom, the last laving been so searee in linglanl, that it was thought necessary to forbin its exportation hy a statute of 28 Edw. III. Still, crube as was their form, and small their number, thearms had establishet a tirm footing in Christendom; their mission of civilisation, and, paradoxical as it may apmear, "f humanity, hal beym. With the first killng lischarge, the doom of fendalism had gone torth. Plated armour no longer availed acainst the wayon of the peasant; and the rualed chivalry, the sinews of previous battles, who had trampled with their iron heels upon popmar rights, no longer could carry all hefore them, lut, like other solders. were now as loath to be slain by unseen foes as the veriest villein in the host. The people liscoverd their powers of contending with the noblesse: hy degrees, they rose for liberty. and surpressel the tyrannies of the petty lords who hal long held them as mere bondsmen. In war. again, as artillery became more reneral, so the slanghter of battles diminished, for an army ontmaneurred was an army at the enemy's merey, and therefore beaten: whereas, mevionsls, in the hand-to-hand fights whore victors ant vanqushed mixed pell-mell in sincle combat, a victory conll only be really won when there were no foes left toslas: A battle as mreat as that at creey might now be gained with a loss to the vanquished of not more than 1000 men, instend of the $30,000 \mathrm{who}$ are said to have fallen victims to the Euglish sword or hoss.

Dating from the reign of Edwarl III., the coployment of cannon and hombards in siege operations became more or less general. Froissart records that the lback Irince took lombaris. cannon, aml lireek fire to the reduction of the eastle if Iimnozantin in 1.36, but it does not aplum that he ayailed himself of tirearms at the bibtle of Poiticos in the same year. The hombaris seom to haw been short, capacious ressels, from which stone halls wore shot with small eharges to a short listance, and at comsiderable elevation ; they were "ssentially the parents of the present hombas menertars (see fige 2 ). "1"be cannon (cenno, a reed, on the other hand, were, for some time at last, of extremely small hore, scarcely larger than muskets of the isthe e.: they disehareed leaden lullota, and would have prubaluly beern used as
hand-weapons, hout for their combrous and heavy workmanship, which necessitated small carriages. Arus of this deseription are dountless those

Fig. 2. from the Chroniques de st Denis, Fourteenth Century. Fig, 3. Bombard of the Fifteenth Century, from Froissart. Fig. 4, Camon of the Fifteenth Century, from Les J iciles de Cherles JTI.
roferred to as hasing been brought by Richard II. to the siege of it Mala, to the number of 400 pheces, where they are said to have kept up an incessant fire day and night on the town without success.

In the Jith e., armies for siege operations were usually acempaniced by great and small guns, the latter being intended to keep down the fire of the lesieget white the large bombaris were being loaded, an operation requiring no small time. These guns were gradnally improven, lut it was not motil the reinn of Henry VllI, that the founders succeeded in casting iron ordnance, to the entire exclusion, until quite the mesent day, of eannon formed of square or rounded bars welded together. England hail even then become famous for the workmanship of its ordnance. The accompanying sketeh (fig. 5) of a gun found in the wreck of the Mary Rose, which sunk at

Fig. 5.
Suitheal in the abore kinc's reign, will slew that a degree of excellence lad been attained in the manufacture of artillerr, little inferior to that which has lasted till our own day, when rifled ordnance are rapidly superseding eannon of smooth bores. Still, so late as lIenry's reign, although great guns were fnumd very servieeable in siege and naval opera. tions, where the defences of those days offered but a trifling resistance to their power, they appear to hare been looked upon rather as an cneumbrance than an adrantage with armies in the field. This is attributed partly to the heavy character of the cruns themselves, and especially of their carriages, Lut more particularly to the badness, or rather absence, of the necessary roads for their transport. In 5\%2, it is recorded in the state papers that the 'linges ordonauns [were] inable to pass over Stanes More towards Carlile.'

As time passed on, the details of the manufacture were improved, the general principles remaining the same; the size of the guns increased, while the proportionate weight of the carriages diminished; limbers ( $f, v$ ) were arlled, and the equipage of a gun gralually perfected amd lightened. With increased calibre, to which angmented range was usually atded, the mumher of cannon-at one period enor-mons-taken with an army was by degrees reduced,

## FIREARMS-FIREBALLS.

nntil now a certain standard proportion between artillery and infantry is ordinarily maintained. Three guns to a thousand infantry is the proportion now considered best (1573). Of course, this proportion differs with the npiuions of various commanders; but the greatest modern generals have always acted on the maxim, that it is wasteful tor sem a soldier on any duty of danger which a lall can lis made to perform. As a weapon of offence, Viaulan doubled the utility of heavy ordmance when he applided the lifoochet (q. v.) system of tiring. Napulem may almost be said to have won his lattles liy artillery, for he rarely if ever brought his infantry into action except as supports, until a way had been opened for them, or a panic causent, by the massed lire of large batteries of guns, The Duke of Wellington also devoted the greatest attention to his ordnance. train ; while, referring to recent events, the campaigns of Lord Clyde in ladia were remarkalle instances of the use of artillery being pushed with abundant success to its greatest limit. During the Franco-(terman War of 1870-1571, the Prussians were considered somewhat behind the age in their use of artillery.

Camon of widely varying hores have at different times been east, and the various sorts became so numerons in continental armies, as at one time to cause much inconvenience from the large quantities of ammunition which it was uecessary to carry. Gustavis Adolphus set the example of reducing his guns to a few standaril calibres, and the same improvement was immediately adopted systematically in the French and other armies. The cannou recently in use in the British army are detailed under the article Casvos; but the introduction of ritted guns of late years has limiten the classes to the following: Musde-loaters-12-inch, 35 tons ('Woolwich lnfants') ; 13 -inch, 23 tons; 11-inch, 2., tons; 10 -inch, 18 tons; 9 -ineh, 12 tons; 8 -inch, 9 tons; 7 -inch, 7 tons; 64 -pounder; 16 -pounder; 9 -pounder; 7 -pounder (steel) mountain-gun. Fireech-loaders- 7 -inch, 64 -pounter, 40 -pounder, 20 -pounder, 12-pounder, 9 pounder, 6 -pouder. For a particular explanation of the several sorts of cannon, see Gundery, Cannon, Cahionamps, howitzer.

The mortar differs from all other guns in its solility, of form, its shortness, and its large bore. The object is the projection of shells by a nore or less vertical fire, with the intention of breaking through and destroying, by weight and explosion together, roofs of magazines, pulific buildings, and so on, or of sinking a shell deep into carthworks of a fortress, in which it shall explowle as a most deadly mine. The different sorts of mortar will be described under Mortaf. The mortar arose

Fig. 6.
From Leonardo da Vinci. naturally out of the old bombari, and doultless deviated by degrees more and more from the camnorl. Fig. 6 shews a bombard or mortar designed in the 15th century. In yery early days, we read in Arabian authors of a cylinder hewn in the rock at Alexandria, and used as a mortar. Such a cylinder, and of large size, is still to be seen at Gibraltar, where it was employed in the last siege against the Spanish, when it was made to discharge volleys of large stones, which spreading at times to a distance of 500 yards, constituted a formidahle means of defence. In recent years, nearly all grans fire shells, so that the specific neeessity for mortars has greatly diminished.
A gua is a frustrum of a right cone, with a
cylinder (bore) removed around the axis; from which it follows that the thickness of metal is greatest at the breech, where it lass to withstand the effect of ignited mowder in its most condensed, and therefore most powerful state. Guns are lirst cast in loam or dry sand, then turned to the required shape, and lastly lored with the minutest accuracy. Formerly, they were cast with the bore already formed; but the direction was rarely exactly correct, and the surface scarcely ever strictly "yen. Some additional marticulars of their manufuturo will be given muder Gux-factones, liosal; and the science of artillery will be summarised under Guxyery.
An article on frearns would be incomplete without some allusion to the progress made in small-arms. In the 15 the c., the smallest surt of cannon were probally at times mountel and used as haml-guns. From this the step to the arguebus was rapid: that weapou developed as years passed into the clumsy matchlock: that into the firelock and flint-minsket ; then the proreussion-musket; and lastly, into the beatiful rifles of our own day, which have culminated in the central-fire breccli-lomlers. For diminutives, small arquebuses were nade to do duty as lurse-pistols; genuine pistols succeeded thens; these were gradually improven and reduced in size, till they have culluinated in the salmu pistul, awailable for a waistcoat-pocket; and tho deally revolver. which 'pualroptes a man's slifensive power. All these weapons are d-seribed under their respective heals-Arocebce, Mathlock, Musket, Pistol, Revolver, liffle.
Many valuable works lave beea written on firearms from the days of Leonardo da Yiaci aurd Tartaglia to the prusent. Among those consulted fur this article have been L'tudes sur le Passé t $t$ l'senir do latillerie of the Lompuror Napulem 1II.: Our Engines of War, by Captain Jervis: Major straith's Treatise on Artillery: General Chesney On Firenrms, \&e.
finearms, lmanive of (in Law). In conse. quence of the frequency of accidents from the loursting of insufficient barreds, the legislature has intericred, not to regulate their manufacture directly, but to prevent all pressons from using or selting them until they have becn regularly proved in a public prorf-house. The first act ior this purpose, which was passed in 1813, was sonn after superseded ly thic fuller and more complete one ( 55 (ien. (11. c. 59). By this statute, it tinc of $\mathbb{x} 90$ is impused on any person using, in any of the progressive stages of its manufacture, any larrel not duly proved; or any person delivering the same, except througth a proof-honse ; and on any person receiving, for the purpose of making guns, any harrels which have not passed through a aroofhonse. These penalties are to be levicat on contiction before two justices, and the like premalties on persons counterfeiting the promf-marks. The statute does not extend to Scotland or to Ircland, and arms mannfactured for ller Majesty, are exempten from its mperation. By 10 Gco. 1Y. c. 38 , repealing 6 Geo. IV., the malicious and unlawful use of firearms in Scotland is punishable. Sce Gane Laws.

FIREBALLS are projectiles occasionally discharged from guns or mortars, for the purpose either of setting fire to, or of merely illuminating some work, against which hostile eperations are directed. The usual ingredients are-mealed powder, 2 ; saltpetre, $1 \frac{1}{2}$; sulphur, 1 ; rosin, 1 ; turpentine, 21 ; with pitch, tow, naphtha, \&ce, as circumstances dictate. The use of fireballs has, however, been in great measure superseded by the introduction of rockets (q. r.),
and incembary shalls (u. W). Alim to the firmall. W.1s the firmerome of anchent wariare which cont

"ranet, ame was quite broileal; then he melted putch aut wax with sulphur, which he drank thwn as it thamen; I satw it dhaming in his mouth is gond while: the also towk up a thick piece of iron, anch as lameresses nse to put in the smoothing. boxers, when it was firry hot, held it letween his teeth, then in his hand, and threw it about like a stome : then her stom on a small port, and bending his berly, terk a glowing iren with his month from between his foct without towching the phe in cround with his hands; with livers other mandigims forts.' . Nome lsis, sigmora Jonephine "imatelli, who described herself as the origital sulamander, performen astmishing feats of this kimb in Londent and other places in Euglamb. Acomine to the acesunts of her, 'Sle commences har purnmances ly passing plates of red hot irna wher hergs : she then stands with her feet maked on a plate of wheot irm, and afterwats draws the same phate wer her hair thel acmas her tongue, $\therefore$ A. Abrat the same time appearel is laris $M$. Chambert. whon astonishing luwers of resisting heat attracten the attintion of the Sational hustitute. Amomg other things periomed hy this person, was his ging inte a common baker's usen, with a leg of mitton in his hands, amd remaining with the ofen closen matil the mutton was completely dressed. Another of his performanees was standing in a flaming tar-barra motil the whole of it was consumed around him. He subsequently exhibited in Lumbon.

Many of the feats of this kime are undoubtedly mere tricks, or illusims, produced ly sleight of haml ; uthers are capmbe of scientific explanation. There is nothing mone womerful in stuthy blazing tw into thac mouth-a commen form of montelank fire catine-than in cating daming phom-jmbling, on in cliphing the finser into spinits and letting it bum like a candle. It is also whll known that the thage, on the hand dipped in water, may be rubbed with impunity against a white-hot bar of iron; the hayer of raperi developed between the bot metal and the skin prevents contact amp probluces coolness
 fommances as those of M. Chaulnert are explained by the well-known power of the living holy to maintain its nomal temperature, for a time, inlependently of the external temperature (see Asimal Mest).

FHRE-ENUNNE, a machine employed for throwing a jet of water for the purnose of extinguishing tires. This mame was furmerly applied to the steam-cnuine. Nachines for the extinguishing of fires have teen used from a very carly date. They were emphed by the Lomans, and are referred to by l liny; lint he gives no accomat of their construction. Sinlledurus, architect to the Emperor Trajan, speaks of leathern bags. with pipes attached, from which water was projected hy splneezing the biogs. Hepo of Alexamirna, in his Treatise on Pnenmaties -written probably alsout J50 years before the Christian era-joroposition 2-, de escribes a machine Which he calls "the siphons used in conflagrations.' It consisted of two erlinders and pistons connected hy a reciprocating Theam, which raises and lowers the pistons alternately, and thus, wath the aid of balves opening only tomards the: jet, projects the watur from it, lout not in a eontinuons strean, as thi. pressure ecases at each alternation of stroke.

The accompanying copy of Hero's diagram explains itself. Little or mothing is known as to the "xtent to which engines of this kinl were practieally uspd. Wie have accounts of "instruments for tires." and 'water syringes useful for fires,' in the miding accomnts of the city of Augsburg, 1518 ; and in 16 an, Caspar schntt deseribes a lire-engine used in Nuremberg, which must have been almost

## FIRE-ENGINE.

identieal in construetion with that deseribed by Hero. It had a water-cistern, was drawn by two horses, was worked by 28 men, and threw a jet of water,

an inch in diameter, to a height of sofeet. It was not until late in the 17the that the air-chamber and hose were athet; the tirst heing montionel by Perranlt in I6S4, ami the hose and snction-pipe being inventer ly Fim dur Iteide in 1670 . In Englant, hatel-squirts were used iop to the conse of the Ibilh century: They were of brass, anet containel three or fomr quarts of water. 'I'wo men held the hamelles at the sides, while a third forcel up the piston. The nnizzle was dipred in a vessel of water after each dischares, then raised, and the water again forced out. So clumsy an apmaratus could have been but of little service in the fearful contlagrations to which our old woml-built towns were so sulbject.

With the ashlition of the air-chamber ano hose, and some improvement in the details of construction, the 'siphons' of Hero beeame the modern fire-engine. The principle of the action of the airchamber, and of its connection with the pumps, de., will be easily understool by the aid of the ammexel diagram, where $a$ represents in section a piston ascending, $d$ the other piston descemang, $f$ the pipe or hose commumicating with the water-suidy $g$ the hose that convers the issuing stream to the tire, lo the level of the water in the air-chamber, $c$ the space alowe fillerl with compressed air. The rising liston raises the water from if to fill its eylinder ; the descencling $\mathrm{l}^{\text {iston }}$ forees the water contamed in its cyliniles into the bottom of the air-chamber, and therely compresses the air in $\rho$. The pistons rise and lesernd alternately: The conpressed air reacts by its elasticity, and pressing unon the surface be, forees the water through the hose $\%$. In the space e, alove be, the whole of the air that formerly tilled the chamber is supposed to he compressel. Assuming this to be one-third of its original bulk, its pressure will be abmit 45 liss to the square inch, and this pressure will he contimous and nearly stealy, if the pumps act with sufficient force ame rapility to keep the water at that level. As air may be eompressed to any cxtent-and its elasticity is increased in exactly the same proportion -the force that may lee stored in the compressed air is only limited by the force put upon the pumps, and the strength of the apparatus.
Under proposition 9 of the same work, in which 'the siphons used in conflagrations' are described,

Hero deseribes and figness the air-chamber as in hollow globe or other ressel, into which if any liquid be poured, it will be forced aloft spontaneously and with much violuce, sor as to empery the vessel, though such upward motien is contrary to nature.' The glowe is represented with a single piston attached for eompressing the air. Thus, about 1800 years elapsed before proposition 9 ame proposition 27 of this work were put together for so nbwious and useful a purpose as the tire-engine, although the book was toleratly well known th the mathe: maticians of the perionl; and when they were put together, it was probably done ly a praetical man, who hat never heard of the name of Hern.

The more recently constructed fire-engines include contrivances for preventing the entrance of mud and gravel, and for getting readily at the valves in case uf their being out of order, while the eistern is dispensed with, a lose being carried directly to the water-sulply. "They are usually drawn by two or four horses, though smaller engines are mate to be drawn ly hand or by one hurse. The hose is of leather, fastened by metal rivets, instead of the sewing formerly used. lo the l nited States, cotion is woven into a tube by machinery constructed $f$ m the purpose. Two such tubes are fitterl one within the other, and held together by a solutions of Indiarubincr, which, on consolicating, forms a water-tight layer.

The fire-engines of the Lonwon Fire lrigate establishment have usually 6 -inch barrels with 7 -inch stroke, and throw about 70 gallons of water per minute. Their weight, with implements, tiremen, and driver, is about 30 ewt . These are found more convenicnt for anemal purposes than larger engines, as they ean be drawn at a gallop ly two horses for a distance under six miles. Fum liorses are used for reaten distances. When a large engine $^{\text {a }}$ is regured, two of these may be joined together, and throw 180 gallons per minute. The pumps are workel by levers, with long horizontal bars attached, to enable a number of men to work together upon the same pmons. Many larger engines than these have leen coustructel, and steam has been successfully applied. The tirst application of the steam fire-engine was made when the Arryle looms in Immion were burned in 1880 . Several floating iire-engines for conflagrations near the Thames have been constructed and worked loy steam; one of these is capable of throwing 1400 gallons per minute. A floating engine was used with considerable effect when the Houses of Parliament were Lurnesl; lut at the dire of the warehonses near Lonlon Bridge ( 1561 ), the fury of the combustion, when at its maximm height, was so great, that the combinel eflurts of afl the London ingines, whether worked ly steam or loy band, had no perceptible eflect in subduing it. For all ortinary tires, the hand-engines above referred to are the most uscful, as they can be l,rought to the spot and set in action immediately. Nevertheless, so greatly have the steam fire-engines been recently impored, that stem of 100 lh . pressme on the square ineh ean be raised in seren minutes after making the fire.

It has been questioned whether, in cases of very intense combustion, a comparatively small strem of water has any subluing effeet at all-some assert that it may eren inerease the conflarration. Various chemieal liquids have been proposed as flame-extingnishers; hut plain water is still the only power used to any cxtent.

Fire-likigndes.-Far worline fire-engines, a body of firemen are reguired. The fire insuranee companies formerly had selarate estahlishments of
fire-engives and firemen; but in 1825 some of them
 condumel, and the lablon line-hrigade was iommal. under the anamanent of the late Dle limatwomed, whow death an the diswherse of his duties at the -reat tire just referred tio was fustly deploped theonghat the conatry as anational lasis. In wion an wh of parliament ampowered the Metromhtan
 anees of the Lomion Fire-lonigake estallishment; to sectre the sorvices of the brigade men; the conntract alditional engines and statimes; to map out the netropalis into convenient districts : and to cause the diremen to act in hammon with a salsage corgs and a fireoseatue coms. The engines nus nsed are very powerfal; the manal engin's are for
 fire-entines, ospecially those construeten hy alesses Shand and Nasm, on a principle patented in 1570, will throw in jet to a vertecal hoicht of 180 fect, or drive water through half a mile of pipe lerizontally. At a fire in the East India Locks in fsibio, the stem limencines pared in the enermons quantity of $3 . n m, 000$ gallons. At the latest great lire in Iomom, that of the Alexamira lalace, in June lais, a powerfal fore of engines was present, but there was insulficient water to render then dfective. The estahlishment comprises about 100 firemen, 55 stations, !n manual engines, and 35 stean-engines (is of them hlating). Is the Metropolitan loard in Lomlun pay a fee to the first person who gives nutiee of a fire at the cngine station, there is always is siply of volunters from among cabmen and jemp in the streets, besides poliemen, to perform this impertant serviee; ant in like manner the pump-hars of the dire-cngines are always fully manned. The men of the brigade wear a uniform, with strong helmets and metal epanlets, to protect them from the blows of falling beams, \&e. The courage and skill of the men in making their way through and about burming buiddings, for the purposes of dirceting the stream from the hose, (1) fin swing hie anl property, and the seneral eflicinely of the whole organisation, are worthy of the highest praise. The water-sulply in Londem is not so well manased as the engine-suply, thereby frustrating the excrions of the firemen.
Most of on provincial towns now have a firelrigale upon the same model as that of London. The fact that l'aris las several tines as many firemen as Lonvion, is a tolerable proof of the amount of work the Lombon firemen aro called upon to forfom. It Jaris, as on the continent generally, the tireenfins and firemen are muder govemment
 emphwerel to enfore the assistance of any people they eno find in the strects.
Ji many continental towns, firewatchmen are stationed in commandines situations, such as ehurchtowers; and their luty is to ring a fire-bell, or otherwis, five the almm, immediately mon observing a conilaratim. The fire-companies of the United States are composel of vohnter firemen, who receive nu lay, lint certain immuntics from taxation and militia servec. Their ammal paradeday is quite a fete: Fach comprany has a special umfom; and in sombe cities the rivalry amons them is so great, that they fremently have desperate fichts for the best "lowation' for their 'angines. Irizes are awarcel to thome whose cugimes throw a jet of water to the greatest hought. An admirable. system of electro-tclegraphy has been adopted, to pive notice from station to station in the event of fire. Newertheless, American cmathgrations are often frinhtinlly destructive: wituess those at Chicasen in 1571, and at Boston in $15 \% 2$ and 153.

In Constantnople, there are two fire-tuwers, one
on cach side of the Godden Ilorn, with watchmen contmally stationed there. A large wieker-hall is hamben up to the side of the tower as a signal, and tha ery of "There is at the at Scutari, Tophame, or whateror be the garter of the eity in which it onemes, is mased and taken up by the patrol, who striks the parment with their iron-bond staves as they mpeat the cry. In at fow minutes, the alarm is thas spread throughont the whale eity.

FIRE-ESCAPbs. An immense nmmber of enntrivanes have been at different times proposed for enabling people to escape by windows and honse-tops from burning lmilhins. They are of two listinct kinds-one for affording ahl from ontsith, and the other for enabling those within the house to effeet their own escerpe. Of the latter, the simplest is a cord that should lue firmly attached to the window-sill of every slecping-apartment, and coiled me cither in a ime on the floor, or muder a dressing-table, or other suitable place. A rope one-quarter or three-eighths of an inch thick, ani knotted at intervals of about a foot, is well alapted for the prorpse. A good quarter-inch sash-cord will support from three to four ewt. or more if new, and will cost from $6 d$. to 2 .., aceording to the height of the rom. A man with tolerahle nerve may let himself down by means of such a end, either ly phacing his fect against the wall and bringing 'Hand over hand' down upon the knots, or ly clinging with his feet and knees to the rope as well as with his hamts. A man may let down a woman or clild by means of a sack at the end of the rope, or simply by fastening them to the end, and letting the rupe pass throngh his hands, aided if necessary by the friction of the wimbow-sill, if it be allowed to bead over it. A rope coiled upon it drum inside a dressing-talle, with a winel-handle to uncoil it, is another form. A pulley fixed to the windowsill, over which runs a rope with a chair or simple hoard to sit on, is a well-known coutrivanec.

Some means of estape from every sleepingroon should be froviled, and the inmates should be thoronghly prepared ly knowing heforehad how to act in case of a fire chitting ofl' communication with the usual means of ontlet. In a row of houses with projecting balconies, a board of sufficient length to reach from the balcony of one house to the next may he kept in each room, or ceven a rope might be thrown across with the aid of a stone or lump of coal, \&e., tied to one end. An exit by the roof or from the window on to the parapet affords a realy means of eseape from a top-story, and should always be provided in tall houses. In ease of emergency, when no provision has heen made, the cord holding the sacking of the bedstead may be undone, or the bedelothes and cartains tied together tor form a rope: or as a last resoure, the hedring may be thrown out of window to form : cushion to alight upon in ease of the eord or betclothes being too short to reacli the ground; or if there le no time to extemporise such corlage, and it should be necessary to drop directly from the winlow, in this case, it would be better to hang by the hands from the window-sill and then Urol, than to jump dinect, as the height of the fall would be somewhat diminished thercby. In all surls cases, presence of mind and coolness is of the utmost importance, and may render very simple and slenter means of cseape more effectual than the most complete and daborate would be without these qualitics; and presence of mind may be to a great extent acquirel ehielly by being mentally prepared, and, it possible, ly rehearsals of what shomble the ine case of danger.
lire-escapes, to be used from withont, consist cither of simple tadderskept in churches, police-otlices,
or other convenient stations, or a series of ladders that ean he jointed together; of poles with baskets attached; of ropes with weights at one end, that they may be thrown or shot into windows; of eombinations if ladiers, ropes, lags, baskets, nets, \&c. The fire-escape now merally adopted by the Seciety for the Jrotection of Life from l'ire is a liuht carriage or framework on wheels, to which a series of latders, 步e, are attached. It is thas described lyy the society: 'The main ladder reaches from so to 35 feet, aud can instantly be aphlin to most soccond-thor windows by means of the carriage-lew., This projects on the oprosito side to the lahler like the sliafts of an urdimary carriage, and wirks uph the axle of the wheels as a fulcrum. "The apper lather frhes over the main ladder, and is raised into position by a rope attached to its lever-irons on cither side of the main latder; or, as recently aloped in one or two of the escapes, by an arrangement of pulleys in lieu of the lever-irons. The short lander for first-floors fits in under the carriage, and is of the greatest service. Under the whole length of the main ladder is a canvas trongh or bagging maile of stout sailecoth protected by an onter trough of copler-wise net, leaving sufficient rom between for the yiclding of the canvas in a persm's descent. The adulition of the copper-wire is a great improvement, as, although not affording an entire protection against the canvas failing, it in most cases avails, and prevents the possibility of any one falling through. The soaking of the canvas in alum and other solutions is also attended to; lnt this, while preventing its thaming, cannot remove the risk of aceident from the fire charring the cantas. The available height of these escapes is about 45 feet; but some of them carry a short supplementary ladder, which can loe readly fixed at the top, anil which increases the length to 50 feet.?
This society has upwards of 100 of these fireescapes stationed in different parts of London. They stand in the roalway, and are each under the eharge of a conluctor during the night. Almost every house in london is within two ur three minntes' rum of one of these. Since 1836. when the operations of the society first commencel, they have saved thousands of lives. At one tire, nine lives were saved hy one man and tire-escape. Fireeseapes of similar construction are now stationel in some of our provincial towns. When required, they are rum to the hurnine house, the main lander stauding nearly moright all the while. It is then firected to the required window at a consich $\mathrm{r}^{\circ}$. able inclination, and the attemiant ascents the ludder, and hel 1 s the immates cither to descend hy it, or if they are unable to do this. he lets them down by the eanvas trough, which forms an inclined plane, along which they may easily and safely descend with the aid he is cmabled to afford them.

FllaEFLY, a name common to all winged luminous insects, at least to all that prossess mueli luminosity. Excepet the lantern-dy (II. r.), they are all coleop,terons, and helones to two nearly allied tribes Lampyrilles, to which the flomworm (f. r.) also lelongs, and Elaterides, to which belong our skipjack beetles, and of which the larvo are too Firelly (Lampyrts Italice). Well-known to farmers as wire-worms. The male glowworm, which alone is winged, has too hittle luminosity ever to receive the name of $F$, but the
firctlies of the south of Lurgre (Lampyris Italica) and of Canada ( $L$. corusce ) are nearly allied to it. See Giomwors. Firetlies are only seen in the most soutliera parts of Eurone. They abound in alnost all the warmer parts of the word, and the brilliancy of the slectacle presented by them when glaneing about in numbers amilst the clarkness of winht, has leen often describus with enthnsiastic adiniration. An Gusse says of the Canatian F : "The light is of a yellow colume very different from the hlueglean of the English glownome from this circumstance I at first took them for candles in the woods, and thouch told what they were, at eremy "ne that appeared, the sane idea wonk come across my mind.. . . They more freguently give out the light while flying, than when rawling or resting, thuugh we may often observe the intermittent gleam as one crawls up a stalk of gass, or rests on the luaf of a tree. They dy slowly, and as they fly, emit and conceal their hight with great regularity at intervals of two or three seconds; making interrupted lines of light through the air. fleaming slowly along for about a yard, then sudilenly quenched, and appearing asain at the same distance ahead. The insect is a pretty bectle, with soft clytra, of a lightbrown colour. marked with red, anel handsomely striped; the light proceeds from the last three segments of the ablomen, which are of a delieate eream colour lyy lay. It night, these three sements are loright it all times; but at the regtar intervals 1 have mentionel, they flash ont with dazzling spleudour. If this part be plucked of and crushed, many pratehes of lrilliance occur for a few moments among the tlesh, but they gradually die away.' He further describes these fireffics as apparing in great numbers in summer evenings, wer wet and marshy ground, millions of them above a river, or orer the surface of a large fiell, like stars un a clear winter might, lnat tlashing and disapucarmg, and moving about in mazy evolntions.-But still more brilliant are the fireflies of more tropical regions, beloncius to the tribe Elateridow, as the F . of the West Indies (Elater noctilucus). which gives out its light chietly from two eye-like tubercles on the thorax. The light is so jowerful. that the smallest print may be reat by it ; and this hecomes quite easy if is few of the insects are
 cnelosed in a small glass vessel. Theyare not unfre- Firelly (Ehetw mehilucus). quently employed-parti-
chanly in st Domingo-to give light for househoh purposes: and they are used for purposes of decomtion on festivaldays by women, who attach them to their dress or to their hair. One which hail buen accidentally brought alive to Paris, mee astonished and alarmed the Fanbourg it Antoine. These insects are canght in some parts of the West Indies-a torch heing used to attract thems-anil brought into honses to destroy mosquitoes, which they eagerly pursme and devom: S'e Lomivasity of Lisects.

FI'RELOCK, the name applied on its intronuetion, in $169 \%$, to the ohl musket. which produced tire liy the concussion of Hint and steel, to distiaguish it from the matchlack previously in nse, which had been firel lyy the insertion of a limhted mateh at the pawier-pan. Writers of the earlicr part of the 1Sth c. ealled firelueks 'asnaphans:'a word obviously cormited from the Dutch smophaan, and leadins to the inference that they Were brought to England by

## Flle P-POLICY. Sce linerance.

Fll:E-PROOF BU1LDINGS. The poblem of constructing warchures, dwelling houses, \&c., that shall te proof against all risk of contlagration, has not yet been solvil. The liability to contlagration may be greatly diminished by the construction of a linilang, bit camot le entirely averted: and therefore, in all 'tire-proof' luilitings contaming furniture or cother combustible materials of any kimd, the ordinary premono against fire shomble le strictly ohserver. It is wall to state this at the outsent, as, muless it he understond, a so-ealled firepoor huilding may bue more dimgerons than an ordinary one, especially in warchouser, de, intrusted to the care of watchuen ant uthers, who, relyines unnn then sunpoct immunity the name expresses. are liable to nueglect many precantions they would not fail to olserve in a linihing helieval to be dangurns. The mast destructive tire that has ocurred in london since 1666 was that at Cuttun's Wharf, in 1so1, the warehonses of which were what is called 'fire prome.' The great fury of this condtaration depemben on the nature of the funts that were stored. It is searecly mosible to bediese that such combustimbes as tallow, turpentine, \&e. combld have hem stomel in the vicinity if saltuetre, muless those had existem sume faith in their praction isolation from each ather by the tire-pronif divisions of the hambince, as it is ses well mederstond that saltentre, thengh incombastible uif itoulf, intencities to an immense catant the comhustikilaty of all combustihbs, ly suplying them with maluted wxyen when hented in contact or Within at molerate ihstane of them.

Thu hearest approximation to tire proof enonstur. tim may In ohtanem as follows: the walls shmole bue of stom or hrick, :anl :ung ties, lintels. Sc, mentired in the comstruction shand be of irun. "The stairetans slumblat of iron or stomes and the thomes "r lamhare of tiles, conrrete, or stome. Wherever wout is inevitably ased, it shmalu be pepared with
salicate uf sula (sec Finsernoorina). Insteal uf Whalen joists to support the tloors of each story,
archal stome or hrekwork slumbld be used, and this shoma be put tugether with sufticient care to ho indepuntent of the mortar. The roof shond lio constructed in like manner, wowlen rafters heins entirely excluded. The doors shoula be of iron. and the security woulat be much inereased if the dinas betwech any two apmements containimg combustille materials were double, with a space betweon them equal to the thickness of the walls, of course, it is not practicable to carry out all these precantions in a dwellime house, bat the danger from tire may be considerally diminished by attending to some of them. Womben staireases are especially dangerons. The anost infortant combitions for a warehonse are, that each apartment shall he separated from the woxt hy stont walls of non-comducting materials, and more especially, that each shall be as nearly as pussibhe air-tight; and whenever, from the nature of the gools, butilation is repured, it should be obtained by periodically opening the denors and windows. If this latter condition is fuldilled, any tire would extinguish itsclf, umbess there be aloug with the combustible goods some oxygen-giving substance, suels as saltjetre, chlorate if frotass, or other nitrates or chlorates.

It first sight, it may apuar that a warehouse lailt entirely ti iron, wonld he eftectually fire-proot, hat this is far from being the case. ln the first filue, iron conducts heat more readily than any other material used in Buihting; secomily, east-iron is liable to erack and split when suddenly heated or conled. Tron supports may, moder some circumstances, be even more objectionable than wood, for if the water from a fire-engine were to play upon a heated cast-iron givier, it would probally give way immeliately, while a stont womk herm might be extinguished hefore being burned through. When buidings supported ly iron girders are burning, they are far more diagerons to diremen than those with wend, as the experiencel fireman ean form a pretty accurate jubment of the time that burning wooten heams will stanl, ani may move about in their meinity to direct the stream of water to where it is most noeded, but iron girders split and fall without visible notice. It is on this akcount that floors of arched masoury are recommended ahove. In great fres, the leat is sufficient to fuse iron.

Without coning to the expense of making warehouses and mamfactories absolut ly fire-proof, cortain preeantions not of a costly nature might be usefully adopted, for the jurpose of merely checking the progress of contlagration until the amival of fire-rnines. Among these simple mensures, may he inchnded irom doors hinged on stone between different departments: a sullicjent deafening not casily destructible between the ceiling of one story and the dhoor of that alowe: and stone stairs. For remiering timber difticult of combustion, see Fhis-fnomisg.

## FHLEPROOFSAFESANDREPOSITORIES

 are usod as rectptacles for deeds, paper-money, acermit-bonks, ant other valuables. They are now reghar articles of commereb, and are to be fomet in :hmust crery connting-honse, lawyer's office. jeweller's or watchmaker's shop or warehonse, and are indispensalile to banking aml such-like establishments. Our forefathers used oaken eliests secured with irm straps and stads for similar purnoses. That which fromely contaned the croma-jeweds of Scotlianl, and is still exliblited in Whmburgh Castle, is a giod example. Subsequently, irn ehests made simply of stout cast or wrought iron were used.The modern safe has double walls and doors of stont iron plates, and the space botween the plates is filled with some sulstance that shall resist the transmission of the heat which would be readily conducted throun solid iron. The materials used for these linines are very various-saml, dried clay, charcoal, ashes, hone-dnst, alum, gypsum, \&e. The safes of Messrs s. Mordan \& Co., which are largely used by bankers, are lined with a mixture of equal parts of saw-dast and alum. Some makers include small vesseds eontaining liquits, the ressels burst when beated, and the hiquids exert some enoling effect. Alum acts in pearly the same manner. It contains $2 t$ equivalents of water, or nosrly half its weight. At 212 , ten equivalents are Iriven off in
 remaining equivalents are volatilised. It is a mistake, however, to suppose that any of these linings ean remder such a safe really tire-proof; and this is admitted by the more scrupulons manufacturers, who carefully abstain from using the desigmation of 'fire-gruof,' but apply that of 'tire-resistine, which honestly describes all that they are eamble of doing, as they may resist the action of tire for a considerable time; bat whether or not their contents may he ultimately preservel from a fire, is simply a question of the duration and intensity of the leat to which they are exprosed. Their great weight in some cases assists in preserving them, especially when on an apper floor, is sueh a safe would be the first thing to break through the burning joists and descend to the lower gart of the buiding, where the fire is usually the most smothered. These safus are sometimes let into recesses of stont masonry, huilt on purpose, and protected hy an additional double iron door. This, of course, adds greatly to their security. All such safes should of course be sccurel by the best locks that can be made, protecten by every possible precantion against picking, hlowing up by gumpowder, or other violence. See Locks.

FIRE-PROOFING. Attempts have eontinually been made to ronder cotton, linen, and other textile falrics, timber, \&c., incomlustible ; lut at present they have been but partially suceessful. There are many means by which fabrics may be preventel from flaming, their combustion being reluced to a slow smoullering; and the many recont eases of fatal results from the present extravagant ilimensions of ladies' Aresses have rendered the admetion of some st:ch protection against tire very desirable. By moistening the fabric with a solution of any saline substance, which, mon drying will leave minute erystals duposited in or between the fibres, its intlammalility will be greatly diminished, hut the salt imparts a degree of harshness to the fabrie, and in many eases weakens the fihres. Alum, sulphate of zine, and sulphate of soda have leen uscul, and are effectual to prevent Haning, hat they waken the fibre. Common salt dives the same. I'hosphate and sulphate of ammonia are less anjectionable on this accont, lut the former deenmpuses by contact with the hot iron in ironing. Tungstate of sola has been proposed, and is sain to have no injurions effect on the time. Suphate of ammonia, chloride of ammonium (sal ammoniac), and brax, are among the best fitted for domestic use, thongh they are not unohjectionahle. For made-up clothing, lorax is, perhaps, the best, as it is most eflectual in its action, and is the least injurions to the appearance of the article, though it is stated to have some weakening edleet on the fibre; this, lawerer, is only perceptilhe in ease of a tearing strain, and will not bereeptibly danage such articles as ladies' underclothing, or anything else only subject to ordinary wear. Wool has been treated in a similar mannei.

Milk of lime, alum, sal ammoniae, sulphate of ammonia, chloride anil sulphate of zine, sulphenret of lime and baryta, \&c., have been nsed, and its intlam. mability, hut inot its compustibility, is destroyel. Like the fabries, when similarly treated, wool smoulders slowly. The most efficient pratection to wood is silieate of soda. If planks of molerate thickness be brushed three or finur times ow r, on each side with a strong solution, they are renderel almost incembustille; they will only larn when very intensely heaterl. The silicate fuses and forms a glass which envolues the surface, aud even the internal tibres of the woml, if it lue sufticiently saturated, and thus seals it from the oxygen of the air.

Ftlid-ILAIslNG, in the law of Seotland, is the equivalent term for Arson (q. v.) in England. If any part of a tenement, however small, las been set lire to wilfully, this erime has been enmmitted. It is quite indifferent where the lire has com. menced, and the offince is frequently perpetrated by sutting fire to furbiture, or to other ohjects either within or withont a bouse; but it is not regarded as completel, aul is punished as a separate crime, of which we shall speak afterwards, unless the tire has commmieated itself to some part of a building. If the fire originated in carelessness. howuver gross, it is not wilful fire-raising, but a minor offence, pumishal.le with finc and imprisoment. But if the intention was to injure the proprietor of a tenement ly loming, not his honse, but an object in its neighbourhood--e.e.t., a haystackand the fire was aceidentally commmicateil to the house, the uffence is the same as if the fire hat been aphied to the house directly. The intiction of carital pronshment for the offence of tire-raising is now in desnetude. Where a man haros his own house without endangering the life of any une, he has not committed the crime of fire-raising, hat he may be pumshed erminally, if the act was done for the purpose of defrauding the insurers. Till recently, it was the rule in Sootland, that where fire was the result of inevitable aceident, it frecel a carricr or innkeeper from responsilility for any goods that were destroyed in his enstoly, unless where fraud or collusion could be shewn ; but the law in this respect has been altered by the Mereantile Law Amendment Act, 19 and 20 「ict. c. 60 , which jrovides, s. 17 ,
 fur hire, of gools within scotland, shall be liable to make grool to the owner of such goods all losses arising from aceidental tire while such grools were in the possession or enstody of sueh earriers'thus equalising the law of sotland with that of Enyland.

Attempting to sat fire to houses, erops, \&e. is a distinct erime from $\operatorname{Arson}(\mathrm{q} . \mathrm{r}$ ), or the actual destruction of property by fire By 9 and 10 Vict. c. $\bar{\delta}$, it is enacted, that if any one shall attemp, t to set fire to a house, \&e., with sueb intont that the offence, if committed. wonh be felony; and liable to he transported for life, he may be transported for fifteen years (now penal servitude), or imprisoned for two years. The attempt to harn growing erops of com, \&e., is a felony by 7 and 8 (is). $15 . e, 30$, and punishable ly transportation for secen years, or by imprisomment. These otfenees are also misdemeanours at common law. By 24 and 25 Tict. e. 17, s. s, the attempt to set buildings on fire is panishable ly penal servitude for fourtecn years, or imprisonment for two years; if a male iunder sixtcen, to be whilpred.

In Sootland, an attempt tom commit wiliul direraising ( 1 . v.) is an oflence at common law. It is not necessary to constitute this offence that the tire should have consumed any part of the huilding, \&c. Furniture-as a mattress-partly consumed,

 a $\cdot \frac{1}{2}$ aratial l'ersian historian, born towards the end of the 16 h e. ( 1500 ), at Astrabai, on the (Gay ian 346
fal. At a very early age, he went with his father (ihalan Ali Hindu shah to India, where we dimd hun, when twetve years old, at Ammednuggur, in the Dewab, slaring the mstruction whath the latew whe to l'rince Mirun Ihusem Nizam Shah. He afterwaris heane captain in the holy-gnat of Nurtera Nizam shats ; and when this king was Inpused hy his uwn son, F.'s former fellow-student Wha, in his own tum, was teposed anm mordered in less than a twelvemonth atterwards- $F$. went to Bijaprere (098 1., liss A.b.), where Ibrahim Aclil shathle, the reigning monarch, receavel him with erat lobatr. ITe also appears to have conierred a military rank unon him, as, soun after his arrival, 1 ". is mentioned as taking bart in an action against Jumal Khan, in which he was wounded am taken prisoner, but ere long he made his usoluo. His death is supposed to finve taken place slurtly after the year [tide. His wreat work is the Tarikhi firishte, or History of the Alohammedan fower in lmaz, which he finisherl in 1018 n . ( $\mathbf{6} 09$ A.1.). Twenty years were spent in its preparations. and the number of hooks used for, and jartly cmbodiad in it-special histories of certain periols and provinces-amants, accorling to 1 . himself (latroduction), to thirty-five; lut twenty others lesides these are quoted in the course of the work. It consists-besides a preandle or introbuction on the Progress of Nohammedanism 11 ladia, and a timal treatise on the geograplyy and the climate of India-of 12 divisions, treating of the kines of Ghizni an! Lahore, Delli, the becean, (inzerat, Dialwah. Cimbleish, Bengal and Behar, Bonltan, Nimbe, Cashmere, Malabar, and of the saints of lndia. Written with an impar. tiality, simplicity, and clearness rave in an Eastern work, this histury bas become a standard work on the subject, into which it was the first to enter at leugth. Single portions of it have been translated by Dow, Soutt, Stewart, Auderson, de.; but the whole work, edited first ly J, Jiriess (Bombay, 3531: fol. "2 vols.), was also translated by him (londen, 1832 , Sro, 4 vols.). A fuller account of F ', life and writings, by the same, will be found in the sccond volume of the Transactions of the Asiatic Suciety.

FI'RKIN (dim. from finu, the fourth part of a barrel), an old mensure of capacity containing nine mallons (old ale and beer measure). But previous to the year 1803 it had two values, being estimated at eight gallous in old ale measure, and at niue in rid hecr meisuse. The timin is equivalent to $9 \frac{1}{4}$ imperial gallons. See Gablos.

HIHLOT (atcording to Jamieson, from Ang. Sax. fiorth and lot, the fourth part), an ohd Scotch dry measure, of which there were four in a Boll (1.v.). Though differing in value for different sub. stances and places, its refation to the boll remaincd invarible. See Peck.

## Prlinl, See Partnershil.

FI'RMAMENT, a wod in use of old to signify the vault of heaven. The term fomm its way into baglish from the Vuleate, whichambers the Septhagint streoma, and the Melirew lickict, by the latin Firmamentum (Gen. i. 6). Laki:l (from the worb ruke, to leat or strike out) signitics whatever is expmed or stretched out, and was specially cmplayi ly the Helrews to denote the hemisphere abuve the carth, compared (Exol. xxir. 10) to a shdendid and pellucil sapphire. Elsewhere (E\&. i. (2.2 26) it is sluken of as the 'Hoor' on which the throm of the llost lligh is placed. Hence it follows that the motions of soliclity and expansion were both contanal in the llebrew conception of the
firmament. The bluc ethereal sky was regarded as a solid crystal sphere, to which the stars were fixed (compare the colo affica sidera of I'liny, ii. 39 and xviii. 57 ), and which was constantly revolving, carrying them with it. This sphere or firmament divided the waters which were under the firmament from the waters which were above the firmament ;' and the theory of the phenomena of rain, \&e., was, that there were 'wimlows in heaven'i. e., in the firmament, threugh which, when opencl, the waters that were above the firmament descended. 'The same day were all the fountains of the great deap breken up, and the windows of haven were opened,' (ien. vii. Il. The riew entertainel ly the Grecks, and other early nations, was essentially the same. In the progress of astronomical observations, it was found that many of the heavenly bodics had imelependent motions, inconsisteut with the notion of their leing fixed to one sphere or tirmament. Then the number of crystalline spheres were imefinitely inereasel, each body that was clearly imependent of the rest having one assigned to it, till a complex system was introduced, capable of lueing fully understool ouly by the philosephers who formed it. See l'tolemaic System. It was long befare men formed the illea of the possibility of it bouly being maintained in motion in space withont a fixed support, and eonsidering the number of phenomena of which the hypothesis of a crystalline firmament offerel an allarent explanation, we must regard it as having heen in its day a curiuns and ingenious speculation.

FI'RMAN, a word of Persian origin, signifies an order, and is nised by the Turks to denete any official decrec emanating from the Otteman Porte. The right of signing any firman relating to affairs connected with his special department is exercisel by every minister and member of the divan, but the otfice of placing at the beal of the firman the thorfrai-a "ipher containing the name of the sultan in interlaced letters, and which alone gives effect to the decree-is committel to the hands of a special minister, who is called nichandji-effendi. The name apphed to such deerees as have heen signed ly the sultan himself is hutti-sherif. The name firman may also signify a more formal kind of Tukish passport, which ean only be granted ly the sultan or by a pasha.-A written permission to trale is called in India a firman.

FIRST-BUEN (Heb. Beker, Gr. motolukos, Lat. mimogemitus), in scriptural use, signifies the first male effspring, whether of man or of other animals. By a principle of the Mosaic law, and imded of the common law of nature, it was established that the firstlines of all the proluce of creatures, whether animate or inanimate, were in some sense clue to the Creator as a recognition of His supreme dominion. See First-Freins. Under the title arising from this recogmition are to be classed many observances regarding the first-horn of animate beings, whether rational or irrational, which prevailed among eastern nations generally, or which are specially established by the Nosaic law: 1. The first-bern male, whether of nen or of animals, was devoted frem the time of birth to Ginl. la the case of first-born mate children, the law required that, within one month after birth, they sleuld be redeemed by an oflering not excecding in valte five shekels of silver (Exod. xiii. 13). If the child died before the expiration of thirty days, the obligation of redemption ceased; lut if that term were completed, the obligation was not extinguished by the sulsequent death of the infant. This redemption toek place according to a fixed ceremonial. The firstbern male of animals also, whether clean or unclean,
was equally regaried as devoted to Ged. The firsthern of clean animals, if free from blemish, was to be delivered to the priests within twelve months after birth, te Le sacrificed to the Lerd (Deut. $x v .21$ ); nor was it permitted to any but the priests to partake of the flesh of such victims (Num. xwiii. 18). If the animal were blemished, it was not to le sacrificed, lutt to be eaten at home (Dent. xs. 22). The first-bom of unclean animals, not being a fit sulject for sacrifice, was either to be put to death, or to be redeemel with the addition of one-filth of its value (Lev. xxsii. 27 ; Num, xriii. 15). If not redeemed, it was to he sold, and the price giren to the priests. 2. Primogeniture, heth by the patriarchal and by the Mesaic law, had certain privileges attached to it, the chief of whieh were the headship of the family, and a donble portion of the inheritance. Before tho time of Moses, however, it was in the pewer of the fither to decide which among all his sens shouk be considered the first-horn. Noses orlaned that the right should invariably belong to the first-born in point of time.

Ameng other natiens, censiderable varicty existed as to the succession of childiren to the inheritance of their parent. The Greeks, especially the Athenians, exchuled the females of a family so rigoruusly from the inheritance, that in the event of a father lying intestate and without beirs-male of his borly, the nearest male kinsman succeeded to the estate. The later Romans, on the contrary, placed blaughters on the same footing with sens as to the division of intestate property: The Mohammedans gave the daughters a certain share of the father's estate, but only one-half of that assigned to the sons. All the nations of Germanic descent restrictel the suecession, especially in land, to heirs-male. But the Visigoths in Spain admitted females, except in certain contingencies.

The rights of the first-hern in English and Scetch law are noticel under Succession, Primogeniture, \&c. In France, the law of primogeniture fell at the lievolution, in commen with many other relics of the feudal system. How far the results of the change have been beneticial, is still a mont-question among political economists. In the state of Tirginia, also, after the American revolution, a similar change took place; and that the change has heen in accordance with public opinion in that state may be inferred from the fact, that a burent now cemmenly makes, ly will, the same disposition of his property as that which would be provided by the law itself in the case of his dying intestate.

FIRST-FRUITS (Hel. reshith, Gr. protogennemuter and uperchai, Lat. primitic), that pertion of the fruits of the earth and other natural produce, which, hy the usage of the Jews and other ancient nations, was offered to Gol, as an acknowledgment of II is supreme clominion, and a thanksgiving for Ilis loonty, Among the Jews, the institution of first-fruits comprised hoth public and private offerings.
Of the former class, there were three principal efferings: the first was at the olening of the cernharvest. On the day after the Passover Sabbath, the I6th of the month Nisan, a sheaf of new corn, which was cut and gathered with much solemnity; was carried to the Holy Place, and there waved before the altar (Lev. xxiii. 5 and foll.) ; nor was it permittel to commence the harvest-work till after this solemn acknowledgment of the gift of fruitfulness. Again, at the Feast of Pentecost, two loaves of leavened loread, made from the flour of the new harvest, were waved, with a similar ferm of worship, lefore the altar (Ex. xxxis. 22). Thirdly, at the Feast of Tabernacles, in the 7th month, was held

FISH, a naval term of various application. The for is an apmaratus of pulleys cmployed in dragging the thokes of the anchor towards the low after it has heen hoisted to the cat-head.-Fish-front, or puench, is a long picee of oak, or fir, convex withumt, concave within, securely fastened on the injural portion of a sprung mast or gard, to which it imparts rigility. Sidefishos are long pieces of timber dove-tailed on the oprusite siles of a made mast, to give it a circular fom am the repuisite diameter.

FISIIER, Joms, Bishop of linchester, was lworn in 1400 at Beverley, in Yorkshire, ellncated at Michacl House 'billoge fow ineorporated with Trinity College), Cambridge, where he tow his degree in 1491, and of which he lecame mastor in 144. Dlargaret, Countess of Richmonl, mother of 1 lenry VLl., chamel by the repirt of his virtucs and learning, next appinted him her chaplain anl ennfessor. In 1501, he was elected chanceller of the niversity: and in 1.50 , beame dirst Hargaret Jrofessor of Divinity. Two years later, lre obtained the bishoprie of Jachester. For many years after this apointment, he laboured diligently for the welfare of the church and the umiversities. The Ieformation of Lather foum in him-as might lave been expected from his devont ecclociasticism -a stremums, if not an able olyment. In 1527, armpture took place hetween him and Ilemry in regarl to the divoree of Queen Catharine. F. refused to deelare the marriaue nnlawful. From this perion, he digutes in the politien-religious strifes of his time as a stanch millerent of the paracy. Ife opposed the suppression of the lusser momasteries in 1529, and the acknowledement of Ifenry as head of the church in 1531, and therely veited the slislike of the party of progress in the Enclish nation. His credulity-many wouk apply a harsher termin reference to Elizabeth Barton (q. v.), the 'Holy Main of Keut,' involved him in a still more perilous antagnism to the ling. He was imprisoned; and on refusing to take the oath affirming the legality of Ilenry's marriage with Anne Doleyn, he was committed to the Tower, April 26,1534 , where he was treated with great barbarity. A kind hut inconsiderate act of Pope Panl III. now hastencel the destruction of the old man. Ifis Holiness, as a reward of his faithful services, sent him a cardinal's hat in May 533. When Henry was infomen of this, he exclamell: 'Nother if tod, he shall wear it on his shoulders, then: for I will leare him never a head to set it onn.' Ilis rmin was now certain. He was accused of high treason, and after a bried trial, was condemed, and executen, wod June $15: 3$. F. was one of those unfortunate persons who, with ahmulance of personal vitues, tind themselves oprosed to the overwhelming tendencies of the times in which they live.

FISHERIES. The capture of various kinds of fish for the purpose of trade has always been extensively carried on in maritime countries, and in those which are watered hy large rivers; and has been the means in many instances of adding greatly to their $1^{r o s p e r i t y . ~ I n ~ G r e a t ~ I B r i t a i n ~ a n d ~ J r e l a n d, ~}$ especially, this pursuit affords remunerative employment to a large profortion of the population, and forms an unequalled nursery for sailors to reeruit the rogal nayy.
The art of eapturing fish, like other arts, has been brought only liy degrees to its present perfection. In remote ages, tish were caught in the rudest manner ly men who lay on the rocks, ready to shoot them with arrows, or transfix them with
spears. Even yet, in places whieh are only partly eivilised, fish are taken with llankets or sheepskins; and a rourfly made spear, known as a leistor, is still useal in the comutry listriets of the Uniter Kingdom in the illessil capture of salmon. Adrancmg intelligenee, howerer, and the use of fish as an artiele of larter for other kinds of ford, soch leal to more effective modes of capture. Persons who dwalt on the sea-coast becan to exchange tish for animal food killod by the inland hunters, and in this way mitiated a commerce which is now represented by a vast amount of capital and enterprise.
The importance of fisheries, as loaring on the form-sumplics of nations, indand as well as maritime, and as fommers a remunerative outlet for lalmor, can searcely be overestimated, more especially as dish has ever bewn in the greatest demanil by all classes of the permle, and has been in use for human frod from the most remote feriouls. Previous to the Reformation, it was in universal demand in Britain, being the preseribed diet churing the fists arpointed by the chureh.

One grat ${ }^{\text {ecenliarity }}$ of this somece of wealth is that, with slight exceptions, the sea-harvest (if we may so call it) is ripencel, without trouble or expense for the fisher, who only reyuires to provide the means of gathering it ; and that, under certain regulations, it is free to all comcrs. Liver tisheries, except for salmon, are unproductive in Great Britain; and Lochleven is the only liritish fresh-water like the produce of which is marketiable.

The principal tislrerics of cireat Britain inclule the capture of samun, herrimg com, soles, turbot, mackerel, lolosters, oysters, if: Immense quantities of these are in constant demand: the varions lines of railway that branch inlami from the cuast atlord a means of rapid transit, anl have in consequence considerably enhanced the value of sea-probuce, mach of which was at one time useless for want of sutficiently rapil conveyance to those seats of popmlation where it wonld have found ready sale. It is attirmed, indeed, by those who have studied the subject, that inereased demands, emserqent upon improved facintios of transit, have afficted the fisheries, and renderel them less productive than fomerly. The machinery of eapture is being extended every year, and the suplles have now to be broucht from greater distances, the shails frequenting the coast hmes being much exhansted by the incessant inronis mane uph them loy the tishermen.

It is diflicult to obtain reliable statisties of the differtht tisheries. Exceptins the govermuent Board for scotlan, there is no recognised authority on the subject. The following tigures, bearing on the herrins-tisheries of Nootland, wheh are the most important fisheries of the Uniter Kingion, are taken from official returns mate by the commissinners, and ammally laid hefore parlmont. They only represeat the quantity of herrings which is 'cured;' but immense mumbers of that tish are sold fresh, as taken from the sea. The mumber of barrels cured m 1570 was 833,160 , and in 1571 the number was $825,47 . \overline{3}$. Tf each barret contilined 700 herrings, the number cured in the latter yar would be $577,832,500$. It would be no exargeration to say that an etual number would be soll fresh. A large number of the barrels were banded by the government inspectors, a sum of as780 being paid by the chrers for this certificate of excellence. Thu number of boats engaged in the herring-fishery of 1571 was 15,313 ; the fishermen and hoys employed in the fishing numbered 46,546 persons ; and the estimated value of the boats and nets employed in the fishery is $\pm 890,019$.

## FIRIFRIFS

The sonttinhornth herring aro sold not only in firoat liritain, fut in lar colonies and foretign countrive. . It llamburer amb ather eontmontal sorz-
 herronza, anbl "anploy agents who ambially viout the varuns liputioh ports tu purehase supplios. It is for the satisfaction of these forcign bugers that the * lomal is used; it denotos the puality uf the harimes and prevents one class af horings leving sold for anuther elass that may be inferime the primedplates of the herringefishery in Great Writain are at W゙ioh, in Chithness-shire, coutawl. anel at Yarmouth, in Euchand; but that imbustry is also carried on at many other plaes on the britisly sea-hoard, and wh the enast oi lrelant, which is Zuno miles in extent. It is estimated hy the tishery inspoctors for lredand that the total value of the burings eaptural in the Irish seas in $15: 2$ woulh amount to a puarter of a million sterling Sixty. finht millings of herrings were taken at Ifowth alone.

A visit to lilllmgeste afrorls the lest means of ohtamong a proper motion of the fond-wealth oi the sea. many tons of all kimels of fish being daily distributed from that mart. The avorage quantities of white finh estimated to 1 'ass through Billingsente in the course of a year are as follows: Hablocks, $3,500,000$; whitings. 20,0 , 0,000 ; sults,
 erel. $35,4010,401$. This estimate is only at the lesta very ronsth one, as no machinery exists for sathering such statisties. So great is the demand for white fish threnghont the kinghom, that many fishermen run north to the Orkney Islands to obtain them. Most of the coml-smacts carry their cargo alive as far as Grawesmal ; hat they dare not venture fathor up the Thmms, as the dish would not live in its foul waters. "lhe Irish seas are famed for the fine quality of their white fisis; the baddocks of Dublin, in particular, have a great reputation, but during late years they have become very scarce. In scotlimil, a bast proportion of the haddocks are slightly smoked, aud solit as 'Finnans,' which form a vell-known breakfast duleacy in all parts of the comentry. Lame: quantities of cod and ling are cancht, split nu, anil suld in a dried state. During lSFl, the latest fear for which otheial returns have bcen made, the coul, ling, amd hake tishery produced $119,020 \mathrm{cwt}$, cured in that was, in allition to 9945 barrels which wore pickled. The number of these fish canght in 1571 was : $0,582,270$, being $1,117,532$ less than in the pre vinus ycar. The most valuable white fish, indivilu. ally considered, is the aldermanic turbot, which brines a luith price. The supply of turbut is chiclly derival from 5 lalland, the tishermen of that country making the capture of the turbot and the sole a specielite. Vels are also caught in large quantitios at all seasons, and fetch a remunerative price in the Lomion tish-markets. As many as 16,255 boxes of ecls are anmally sent from Ireland to England. Theses buxes will uach contain on an averarge fol 16 . Weifht, and the price at Gl. per 16 . would give a maney value equal to the number of bores. In Seutlam, where a projulice has lomir existed against that fish, the eel fisheries are legrming to prove remmmerative。

The lohster, being ly far the most valnable of the erustacera kind, is most assichunasly nursed in prols su as always to be realy for market. Mr Scovell of llanhle, near somthampon, keeps a thonsan! or two always on ham, and stemm-ressels ar" "mplosval to bring them alive from the monst diotant larts of the cuast: these hoats are linilt exchosively for this purpose, ant have immmonse Welly in them to hald the living freight. The libe ster' are nut at once lronght to Lundou, but are 354)
kept realy in perfaratell heoxes, in various parts if the 'Thames, to anmwer the demame as it arisres. Norwis suplles at leact twenthirls of our lobsters, the alaly consumn dion of which in Great liritain $^{\text {of }}$ has houn estimated at fo,000. The lolsters taken frum the british suas have mow to be somplat for at Hrater distanes from the shure than formerlythove oltained on the immediate coast leing now very small, and techuicaly called 'half lulsters:' thiy do mot, of course, yish sheh a romucrative price as the larger fisli. There is also an enurmous demand for oysters, and a considerable propartion of our maritine pupulatiom carn a comtortahle livelihond ly breeding and dreduing them. At Whitstable, in kent, and at varions places in Essex, there are depots for sorting and storing ousters. The 'spat' is promed and grown in the conrse of inur years intu a marketable commolity of much value, the wholesale prices for the varims kinels having lieen doubled hetween the years is60 and $15^{\circ}, 3$. The oyster usel to lie found in great alumiance on the British coasts, but some of the natural heds have been so largely drawn uron that they are hecomiug exhausted.' The matural oysters if Ireland are now very nearly dredsed up. In America, the oyster is a commou molluse, and nutwithstaning a constantly increasing demand, the uatural bells are still productive. See Onater.

Whilst sea-fisheries are open to all who have the means of working them, salnon-rivers are for the most part pivate property. The owners of particular streans nsually form themselves into an association chiefly for the protection of the fish dining the spawniog seasm. The asual method is for th" "lairds' to let their fishings to teuants, who are callud 'tacksmen,' and whose interest it is to capture and sell all the fish they can find. The rents olitained are, in some instances, very large, and form a bandsome aldition to the land-reventes of the proprietors. Before the invention of packing in ice, and previous to the introluction of steamboats and railways, salmon usel to be hawked through the country towns by cadeers at an aimost nominal price, whilist it was sometines sold in the pulbic markets at twopence per pound. When the increased demand for it, createl by thesc faeilities of conveyance, calsed it to attain its present price, tacksmen were tempted to overtish their streams. and the consequence was the comprative exhanstion of particular rivers: but by the wisdom of the legislature in passiug one or twn proteetive acts of parliament, the salmon-fishories are now (157.3) proviag very renunerative buth to lessees ant laids, the fish having again become comparatively plentiful and increased in size. The rental of the river Tay, in 157,2 , was $£ 17,000$. T'n pay such a rent, and proside for the working expenses of the rarions fishing-stations, 20,100 salmon and srilse, of the arerage weight of 10 lbs . each, woull require to be eaptured. See Salmox, Pisiccletcte.

The following statement of the mumber of hoxes of salmon received in London for the year 1572 will affirel an index to the value of the british saimonfisllcries. Fach box containet 112 lbs. The Enghish rivers include those of Wales :

It is impossible, from the pancity of reliable information, to do more than ronghly estimate the amount of capital employed in the british fisheries, or the value of the stock of boats, nets, and other instruments of capture. However, it is certain that the value of the annual produce of British fisheries of all kinds is not less than $£ 5,000,000$.

A semi-official estimate has been very carefully compiled of the supposed total annual ralue of the fisheries of Scotland (exclusive of salmon), with the following result :

Assuming that as many salmon are caten in Scotland as are sent to London, that would give us 46,056 boxes of 112 lbs . each ; and taking the average price as five pounds per box, the sum, added to the above, would be $£ 230,280$, making a grand total of $£ 1, \pi 35,711$. So materials exist for forming a detailed estimate of the ammal value of the English coast-fisheries. The Irish sea-fisherics are rapidly declining. In the year 1846 , there were nearly 20,000 boats and vessels of various sizes engaged in the Irish fisheries; but in 1822 , the number employed in the fishery was only 5000 . In 1546, the number of men amt boys emploved in connection with the sea-fisheries of Ircland was 100,000 ; in 1872 , the number shewn in the returus was ouly a little over 31,000 . Within a year, the number of boats had decreased by a thousand, and the sea-fishermen and boys hy 7000 .

The food-fisheries of France are now locoming co-extensive with those of Britain, so far as the capture of sea-fish and erustaceans are concerned. A very large number of sardines are annually caught and curct in the French seas, the cure of this little fish being a very remuncrative industry at Concarneau and other places. In the cultiration of those less important fishes which thrive best in lakes, canals, and rivers, the French excel us, for while we only cultivate these for purposes of amuscment \{see Avgling), the French pouple make them an articlo of commerce, and derive considerable sums of money from their sale. At one time, the whole fresh-water fisheries lelonging to France were not of so much value as nate of our salmon streams; but by means of artificial cultivation and careful mursing, they have been much inereased in value, and, hy the care of the govermment, are being yearly improved. The fresh-water fisheries of France are of great extent, some of the fishponds in that country being upwards of thirty thousand acres. These fisheries are all more or less unler the eontrel of the government. In Paris, the annual consumption of tish has becu estimated to give for each indiviclual 30 lbs . of sea-fish, and 1 lb . of fresh-water lish.

Among the foreign fisheries most worthy of notice are the river fisheries of Germany, where the eulture of the Dambe salmon and other fresh-water fish is assidunusly carried on. In the Mediterramean, various kinds of fish are taken, the one of greatest value being the tunny. The anchovy and sardine are also taken in large quantities. An account of the great eel-fishery at the mouth of the Po, on the Adriatic, has already been given in this work. See Comacchio. The Dutch are at present as industrious upon the sea as they were at the
time when they founded Amsterdam, and a large pro. portion of the population of Holland are engaged in their fisheries, which are still a source of wealth to that kinglom. The herring, although not taken by the Dutch in such large fuantitics as formerly, is as carefully cured as ever, Dutch-cured herrings having a great rejutation. Execellent salmon are taken in the mouths of the lhime, many of which are sent to London for sale, as thay can be eaten at a time when British salmon cannot ber obtained. The Norwegian fisheries affind large quantities of lobsters and turbots, while from Newfoundland is derived a plentiful surply of cod or lines. The Newfondiant tisheries, which are principally for cod, have existed for upwards of three eenturies. Sir Francis 1)rake was the first person who tished there on behalf of England, and the fish he sent home soon excited a spirit of enterprise in the country, which led to the dispatch of a large number of ships and the extension of the tishery. The island is surrounded by the cod-banks, and the capture and cure of this fish form the staple occupation of the people. In America, immense quantities of shad are bred artificially in order to aid the natural supplies: the 'pisciculture' of salmon has also heen commenecl on a large scale, that fish having hecome scarce near the seats of great popmlation. See Newfousblisi.

The oil-fisheries are not so important as they were at one time, the invention of gas and the discovery of other lubricants having rendered us independent of whale nil. The success of the whale-fisheries has also fluctuated so much as to prevent molern capitalists from emharking very largely in the trade. The only novelties that dis. tinguish the whale-fishery of the present day are the introduction of steam-whalers, and, in some instances, of vessels wintering in Greenland; lut, with all these advantages, onr whalers barely pay their expenses, and the fishery, as compared with former years, exhilits a considerable fallingonf. The total whaling tleet numbered at one time 159 ships, but to-day it barely amounts to a tenth of that number. The seal is now largely captured for the purpose of olitaining its oil, many thousands bein: annually killed by British sealer:, as many as 15,000 being taken loy the men of a single ship. Sec While, Chiolot, Seil, GreenLaind, \&e. The Sonth-Sea or sperm-whale fishery is principally in the lands of the Americans, who pursue this branch of commerce most successfully.
The British and Trish sea and salmon fisheries are, so far, regulated by numerous acts of parliament. It is quite impassible, howerer, to give a precis of all the provisions which the legislature have laid down for promoting and protecting our fisheries, they are so mumerous, and many of them quite local. The sea-fisheries are, in elleet, free to all who choose to fish; but the salmon is, by use and wont, as also by acts of 1 arliament passed at various times, private property, although the owners of fisberies have had to sulsmit them, from time to time, to the regulating power of the legislature.

The following is a summary of the leading points of fishery legislation :

From a very carly time, statutos have been passed both in England and scotland for the purpose of protecting the breeding of fish, and preventins the destruction of the spawn or fry: The development of the fisheries led to a system of advancing public moneys for their encouragement; for this purpose, commissioners were appointed, through whom money was adranced on loan. A treaty was entered into in 1839 between her

Majesty aml the late king of the lirench, and canded int e chect ly act of parliamont, concerning the fiskers oll the seas betwen the liritish
 whthe whell the eremole risht of tishing is exelu:woly reacred to the sulijects of the twin kingems fe ele "tacy, are fixad at three mites' distance from lum wate inark. With reppect on bays the mouthe of whele fin mot exceed ten miles in wilth, the firesemike distance is measmed from at straight hoe dhawn from beathand to headland. In 1sod, a smalar treaty was concheded lutwem her Majesty and the l'mited states of America, relating, int "file tu the rights of fishery between the British colmies on North America iml the laited states. Fresh tish of hritish taking, importel in hritisl luttoms, may be landed withont report or entry: I'ersoms cumblopel in the tisheries, in such mamer
 fill liw. 111 . $\therefore$ lus are exmpted from imperss ment.

It wond be well if the varions acts of parliament resulatine the fislarges were coditice or arraned in some lughal selpunce: amd the varions fishery whices mint le consolidated under one governing borral, instarl of heins, as at present, seattered over varons publie thputments, or almwistered in sepmath, arlices.

Flallix, liush, i. ar, those which at common law are the property of the crown-are the Whale and the sturgen, when either thrown on shore, or cancht near the enast. The ground of the piviluge is sul to have been the superior value of these fi=lues. 'lhey were considerel too precinus for a sulject, just at the swan ( $\ddagger$. vo), which was a rogal lide was tho gomel fur any table lout the king's. " Gur ancestons," sals blackstone, "scem to have ant retuined ac ray hish notion of the importance of this rinht, it lume the werative of the kings of Demmark and the dukes of Nomandy; and from one of these it was probably derived to our prinees. It is ceppessly clamed and allowed in the statute The Praragetion liryis (17 Edw. I1. e. 11), and the most ancient treatises of law now oxtant make mention of it.'-Steplun's Com. ii. p. 547 . Strictly, it was the head maly of the whale which belonged to the king, the tail leeng a perquisite of the quenconsort (Ih. p. 4.7). In Scotlam, whales thrown on shore athue six horse-power dranght, belong to the queen or lin donatary, the almiral. Smaller Whales have hen elamed both ly the lamdord and the temant on whose gromed they are cast, hut they are usuall siven to the eather. In shetlam, where the warhme of whales on shore is an oecurrence of sutlicint frequency to have gisen rise to a lowal custom, they are equally divided between the poprictor of the suil and those concerned in catehing them. see sithon.

FISHES (l'sers), the fourth-or, accordiug to Mibue-Ddwards and some other naturalists (see AMphima), the lifth-class of vertchrated animals; consisting of eratures which live in water, aud accordingly locath ly sills (tranchior), and not, at any stare of their oxistence, by hongs. In mumber -both of individmals and of rliferent kimesthey are supposed to exceen all the other classes of vertehrate animals put together. Even the water of hot egrings and the porls of emems have their peonliar fishes, and some of these are only known as thrown out with torrents of mully water by volctmes.
'Thu form of fishes is generally adiptent to easy amb rapind frogression through watio, being mone or less nearly that of a spimble, swelling in the midille, and tapering towards the extremities; the
outline mangular. ane the surface smooth. But exerptions to this rule are mumerous; and sume, provided with "ther means of secking their fort, or of prestration from their enemieg, exhibnt the grentest possible hepartures from the urdinary shape: Sime are globe-shapel, some lave a most irregular and amolar coutline, many are much clongated, as aels; and others are compressed and thatened, as thmmates.
the bones of fishes ditier murlo in their struetme from thase of other virtelrate amimals: they are loss , lense amd compract, and when their osailieatwon is perfect, remain separate, as in the carly embryotic state of the Mummalia. The bones of the sub-class of Cartilaginons Fishes (q. v.), howerer, netur become properly ossified. The bones of tishes generally contain is smaller proportion

of eartlyy matter than those of other rertebrate ammats, and their cartilacrinoms basis contains un gelatine strictly so callow. The typical character of the vertebrate skel-ton is, however, maintained, althongh molified; and many of the bones-a great majority, for cxample, of those of the head are evidently homolognis with those of quad. rupeds and of man. There is no neck, and the vertebre are distinguishable only into abdominal and candal. The vertelre are concave at each ent, and piercerl in the midalle, the hollow space being necupjed with it gelatinous sulistance. Spinons processes, sometimes short, sometimes long, extend upwarls and downwards from the vertebre to support the musclos. Fishes also generally have ribs, connectel with the ablominal vertebre: and in many, an additional set of small bones (epipleural spines) commected with the ribs, and arising from near the base of the ribs, extends outwards and backwards through the lateral muscles. The four limbs which belonir to the typieal structure of vertebrate anmals, assume in tishes the form of Fins (q. v.), and are generally, although not always, all present, the first pair leing the preforal, the second pair the rentral fins. In some fishes, the ventral fins, answering to the hind-fect of cuadruperts, are actually further forward than the peetoral fins, and are then called joguler fins. In some, as the common cel, the ventral fins are wanting ; in some. as the Murana, there are neither pectoral nor ventral fins. Connecterl with these fins are bones, which shew that they represent the limbles of other vertebrate animals. Fishes have, however, also other fins not so closely connected as these with the intermal (endo-) skeleton, and not placed like them in paus thwards the sides, but vertically on the midule (mesial) line; one or more (dorsal) on the back: onc or more (anal) on the opposite or ventral aspect, behind the amus; and one (raudal) at the extremity of the tall. The caulal tin is in general the primipal organ of locomotion, and most of the museles of the booly combine to give great energy to its strokes, great part of the buly moving with it, and the vartabre with their processes being so framed as to ahmit great frecdom of lateral, ant scaredy any vertical motion. The pectoral and

## FISHES.

ventral fins seem to serve chiefly for balancing the body, and guining and staying its motion ; the dorsal an! anal fins, like the keel of a shup, for keeping it in its proper position. fll the vertioal tins are snpporteel by bones which do not juin thow of the internal skeleton, but are thekest at the skin, from which the y penetrate towards the vertobre, being interposed betwern the spinous pocesses of the vertebral column. seweral of the last candal vertehra are generally wery short and combined, amel the interposed spines which support the eandal tin converge towards them. The regs of tins are either
 the membrane, and forming dofensive weapmos or they are cartilatinus and jointed. in which catse they nifen also branch near their sumnit. The caulal tin never has any other than these sot rays, and many tishes lave no other in any of their tills. A few fishes, belonging to different families, have the pectoral fins develoned to an wusual degree, so as to make them capable of sumporting short thinhts in the air (see Flying Fish and Fling (ifisuphe: and a few are capable of employine their fins as organs of locomotion in a very different way, ereping: along the gromet, or hopping among the weels amis stones of the shore.

The heart of tishes consists only of one auriele amp one ventricle, receiving venons hombonly, and rembing it to the gills, where being oxygonated, it passes into the preater or systemic circulation by the iomsal vessel. Nee cirn elition. In most thehes, there is. close to the beart, a thick Zull or muscular swellime of the preat artery which conveys the hlood from the beart to the gills, and which assists in propelling the blood, hemer fomished with values to prevent its regurgitation into the heart: and this loul, and its valves exhibit varicties admirahly characteristic of difierent natural grous, mmeh founded unm in the system of Miller and Owen. The hoon of fishes is red; its corpmscles are oval and of considerable size, but in general not very numerons. Fishes

Cheironectes Candimaculatus.
consume little oxysen in reppiration, and are coldhooded anmals, having in general a tomperature little elevated ahove that of the water in which they live; althongh there are some singular exceptiens to this rule, as the tunny, sworl-tish, de.e. which, having a conparatively high temperature, have also redler blood with more numerous corpuscles. The oxygen appropriated by weans of the galls in respiration is not ohtained by decomposition of water, hut from the air which is mixed in 1t, and hence the necessity of aerrating an aquarium;
hence also we percrive one of the beatits resulting from the agitation of the nean aud of lakes by winds. Shme tishes require a creater supply of air than they can easily ohtain from the water, ann frequently come to the surface to brathe. Fishes taken out of the water din from want of lireath, in consequence of the tryins up of the firse fringes of the gills; and those which are cipable of sulssisting longer ont of water than others, have generally sinall gill openinss, not sin freely armitting the air to dry the gills, whilst a few are pronded with rueptarles for water to keel them moist. See Axableitre
The gills of fishes are sitmatel at the back part if the sides of the head, and consist of a multitude of very yasenlar membranous flates. which are concrally in domble friage-likerows fixed loy the hase moly, and simple, although in a few tishes they are feathery, and in the grenter number of Chitileqginous
 and their internal culyes, or consist of mere folls of mombrane attached to the surface of the gill-eavities. In eneral, there are four wills on each side: the number is ereater in some of the Cartilaginons Fishes. In lessuns Finhers, the gill-plates are attached to the external edge of the branchicl arehes, houy arches comectell with the hyoit lome or bone of the tongue - which is manally dereloped in fishesanl with the base of the shall, the connection at both enels beinge eftected by intervening small bones, ant the whole fommin a complicated system; whilst the eavity containing the gills, on each sile wif the hem? is coveren hy a hony date, the gill-hic, sill-oter, w opotulum, with two suhordinate pieces. callerl the sub-operculum and inter-op rculum, artienlated on the temporal bone, and playing on the me-operenln, a hony plate pacel before them in the bear. It is ly the motion of these bony pates that the water is expulletl whicls is taken in by the mouth, and which, after passiug amongst the gills, and supplying them with air, passes ont hy the gill-orifices at the back of the head. Besides these Opercular plates or lones, a series of flattened rays, commeting them with the bone of the tongue, and called the brenchinstegral roys, ail in forming the gill cavities. In the branchiostegal rays, distinctive characters of fishes are often fomm.

The brain of lishes differs very ennsiberably from that of other wertehate anmals. See bram. In general, they pussess the nerves ant organs of all the senses, althongh the senses of touch and taste are commonly surimest to he more dull than in many other animals ; and a few fishes, living chiefly in mud, or in the waters of caverns, are destitute wif eves, and consequently of sight, althongh even they" possess optic nervis, and seem sensitive to light. But in most of them, the eyes are large. and vion is evidutly very acnte; and some have cirri or barbules near the mouth, filaments jroceeding from some of the fin-rays, \&e, which are regardei as delicate organs of toneh, adapted to the wants and habits of the particular species. The eyes are covered by the skin, modifiel in its character, and have no eyelids nor nictitating membrane. They are very variously placed in different kinds. There is no external ear.
The mouth is the only organ of prehension. It is very dhfferent in different kinds-sometimes very small, sometimes extremely large, sometimes forming a sucker by which the tish can both fix itself and pump up the flowds of the anmal on which it preys. The snont is also abbreviated. prolonged, or otherwise modified in rery tarions ways. The teeth are far more varius in form, number, position, and structure, than in any other class of animals. They never have any roots, but are fixed to the bones

Gme of them swallow their foral almust or aldsolutely alive: whers subjeet it to mocesses of cmmmantion, tronation, and mastiertion in the month. Solivary ghais are nut fomal in tishes, althurh they exist in some of the inverte. hrate animals. The digestive pocess secms to be furformed very raphilly. The stwath and intestines vary bery mich in different kinds. The kilneys are in general extremely large, extending throngh the whole length of the alnomen.
"The air-hulder" is fonm in many fishes, hat not in all: and is present or alsent in difterent fishes arell of the same grans or family. See Atr-eladmer. lts uses, and its connction with the habits of partienlar species, have as get been but partially aserertained.

Fishes are oviparms (egg-prolneng) ; a few are nowriparens feres hatched within the buly and yomy probucal alivel. The chicf reprobuctive irgans are generally tro elongated libes of a fatty substance, milt, in the males, and of rndimentary cons, row, in the femalus. lmpregnation usually takes phace after the roe or spuen is deprositen, the male acempanying the female to the plaee of spawning la sume Carthoymons Fishes, it takes flace licture the deposition of the eggs; and male sharks anl rays are furnishel with organs ealled chaspers, the use of which is well inderated by the name. The fecundity of tishes is generally very great. and their equs rory small in perportion to the size which they ultmately attain, although this is not som moll the case in the Cartilarmous Fishors alrealy mentional. sume of the fishes most baluable to man, as the salmon, herring, and cond, are remarkable for their fecumlity. Nime millions of eqiss have, acombing to Lenwenhoek, been ascertained to exist in the roe of a single cod; and provision is thus made buth for the preservation of the species amidst all the damers to which the spasm and the youm are exposed, and for the wants of man. The spawn of times is deposited in very differnt situations, accordiny to the different kimls-as loy sume on apuatic plants, by some on beds uf sand or gravel; but many species leave the dopths of the ocan in urder to doposit it in shallower waters, and some, usmally marime, ascend rivers for this purpose. Very fow fishes take any care of their chge or young; but there are romarkable exceptions to this rulb, and some of the gobies and sticklebacks are known to teml their young with great care. Sticklebacks alsu, construct mests. See Sticklegach it is mat lone since this eurious fact was discoverel, although
these little fintues have heen wo lones familanly limwn: anl it is therefure not improballe that many other fishes may have the same habit.

The erwwth of dishes is sery raphid whon supplies d fombare abmant, but becomes slow in less fovourahle cinomstances, or is arrested for a lomer thene in a mamer to which there scems to be nothing similur ammer other vertelrate animals.

The skin of fishes is gancrally coverel with seales (If. \%), which, however are sometimes minute and imbeded in the skin, and sometimes altogether wanting. The seales are mither lomy or bony, and are Hencrally imbicaterb, lake the slates of is roof, their free emds backwarls: lat sumetimes form lumy phates, fixed ly the whole of their lower sufface. 'They neually exhibit loatitnl symmetrical markings and inequalities of surface of varions kinds, and in some are coverel with a thiek coat of enamel. The differences of charater in the seales have been made the foundation of a classification of tishes lyy Agassiz, by whom all tixhes are distributed ints the fund orders of Cigloul, chencel, Plucoid, and Canoid fishes (sep these heads), having respeetively cyeloid, etenoid, placoid, and ganoid scales: a classification which has ben fomm partieularly convenient with refurence to iossil fishes, although other systems maintain their ground agtinst it as proterable for recent suecies. It is not, however. wholly artilicial, for a relation can be very generally traced hetween the character of the scales and the general structure and centmy of a fish.

The scales of a row astending from the head to or towarils the tail on each sile of the body of Osseons fishes in it sonewhat waved line, called the latend line, are piercel for the transmission of a slimy matter, with which the whole body is lubrieatel.

The colours of fishes deprod upon a substance eonsisting of small 1 mbishel hanine, secreted by the slin.

As fishes need mo eovering, like fun or feathers, to prevent the dissipation of their anmal heat in the surrounding medhum, their seales must be regarded chintly as defensive amour. Sume of them are also defended hy large bung plates, which are cither on the hoad alone or also on the body, and some by spines connected with the fins, gill-covers, \&o. Few have amy other offensive weapons than their teeth, but the spinc attachest to the tail of some rays is a remarkable exception, as is also the elongated snout ur beak of the sword tish, saw-fish, and a few others. Fint a much more remarkahle kind of armourprobably hoth offensive and deforsive-is possessed by a few fishes, in an electrical apparatus, ly which they can give severe shoeks. It is also an interestin fact, that the electrical apraratus is puite diffrent in different fishes possessing it, the Gymnotus or Flectric Ed, the Torpedo, and the Electric Sihmus or Malapterurus. Sce Electmerty. Anmal.
Nany fishes are gregarions, swimming in shoals, which in some specics consist of immense multitules. Some also malke periodic migrations: salmon, for example, ascenting fur rivers, and herrings an! $p^{\text {nileharls visiting our coasts, lut the }}$ hong migration formenly ascrifell to these fishes is now doubted or disbelieved. 'The oceasional overland migrations of eels, ant the more frequent overlaul migrations of some tropical fishes, eannot hut be regarded with pecnliar interest; and the instinct is very wonderful by which, when fleeing from a pool that is abont to lee dried up, they direct their course towards a place where water is more abmodant. This faculty is, however, rare, although fossessed by tropical fishes hoth of the eastern and Western hemispheres: but more generally the fishes destined to inhabit tropical jouds which are liable

## FISHES-FISH-HOOKS

to be dried ul', are capable of living dormant, imbelded in the mud, till they are liberated again by the rains, when they reaphear in their former multitudes.

Of the uses of fishes to man, by far the most important is that of supplying him with food. Fislues form an article of food in almost all comntries, and in some a principal part of the food of the inhabitants. Many fishes are lighly estecmed for the table, which are not procured in sutheient abuntance to be a principal part of fool in any country. Some fishes, on the contrary, are mpalatalle; and some, mostly tropical, are poisonons. whilst others are poisonous only at particular sea-sons.-The skin of some Cartilaginous Fishes yirlds Shageren ( $\mathrm{q} . \mathrm{v}$ ), and the air-hather of some lishes yiedds Isinglass (q. v.). The minnte laminee which give brilliancy of colour to some, and the similar substance found in the air-bladeler of others, affort the materials of which artificial pearls are made. -Oil useful for lamps is obtainct from a nomber. of fishes, and the medicmal value of cod-liver wil is now well known.

The classification of fishes most generally adopted is that of Cuvier, who divides them into OSEEOtS Fishes (hoving true bones), and Cahtimagixots Fisurs (q. v ) ; and dirides Osseons Fishes into Acanthopterons Fishes (Acunthoptery!ii, t. r.), and Malacopterons Fishes (Mulucopteryii, q. v.). The system of Agassiz has already been noticed. That of Ditiller and Owen differs from both.

Fussil Fishes.-The Inedium in which fishes live, and the hard and almost indestructible nature of some portions of their skeletons-as their teeth, spines, and scales-would lead us to anticipate their frequent occurreace in the Sedimentary rocks: lint inasmuch as the soft parts of the animal are liable to speedy decomposition, the remains of fish must often exist in a frammentary and scattered conalition. Thus, the teeth in the shark, the spine defence in the sting ray, and the seales in the bony pike, would survive the total lestruction of the cartilaginous skeleton as well as the soft portions of these fish, ant would alone remain to testify to their existence.

The carliest ichthye remains are of this fray. mentary character. They have been obtained from the 'Ludluw rock;' a member of the Tpper Silurian serics, and consist of spines and portions of skin, that have locen thickly covered with hard tuluereles and prickles, like the sharreen of the shark's skin. The spines most nearly resemble the forsal suine of the dogtish; they are small, Hattened, and slightly curved. Along with other similar fragmentary remains, they have been placed under the somewhat indetinite generic title Unchus.

The minute, compressef, conical, and ghstening borlics, called Comodonts, oletained in great numbers from the Lower Silurian measures in linssia, and considered by their describer, Pander, to have been the tecth of fishes, belong certainly to sery difierent animals. Their small size and jeculiar furms, and the entire rargin of the hollow base by which they were attached, shew them to have been the denticles from the lingual ribbon of shell-less molluses, which bave left no other traces of their existence than these remarkable Conotionts.

The Lullow bone-bed contains the earliest noticed fish remains. No idea of the numerical importance of fishes at this early period can be satisfactorily formed; yet these remains being contined to a single thin bed, ant occurring rarely even in that, wonlil seem to indicate that the Silurian seas were but thinly tenanted by these earliest sharks.

In the immediately succeeding Devomian rocks, their numbers largely increased. The ichthyo.
dorulites, or fossil spines of this period, have heen refermel to fourteen different genra. Nimerous species of true ganoils have been determined from their well-prescrved enamel scales, which occur singly or in confused gronjos, and frequently also associated with the hean, tins, and tail, sis as to present a faithfud 'natureprint' of the tish upon the rock. Dee Dif'teises, Diflacantul's, \&e. But the most remarkable and charaeteristic fossils of this reriod are the Buckler-fishes, whose Lead and part of their body were covered with bony Hates, giving them so singular an? anomalous an ippearance, that some of them were originally consillered crustacean. They are almust contined to the Old lial Sandstone series, a single species (fomml in Termian strata) being the only cephalaspid that is known later. See Cepicilasios, C'occosters, Pterichtirs, \&e.

Fish remains are of frequent ocourrence in the Coal-measures. Cpwards of twenty species of plagiostomons fishes have heen detemmed from the spine defences, some of which are very large and puwerful. The frequency with which the peculiar tereth of the cestracionts are nee, shew that they must have been common in the carboniferous seas. Ganoids were also abumdint. See Paleunisets, Hosorryemucs, \&e.

In the Permian perind, the forms are similar to what exist in the ololer stratio. Ep to the last Permian leposit, the fish have all pussessed heterucercal tails; but with the secoudary rocks, the hommeercal tail not only appears, but becumes the more frequent form.

Numerous species and many new furms appear in the Trias and Oolite. Sharks are remarkably abunelant in the C'retaceous strata: but the C'balk is specially remarkable from containing the earliest discovered remains of the true hone-fishes-those coverel with ctenoid and creloid scaks.

In the 'Iertiary strata, the eharacter" and pros portion of jehthye remains exhibit a eomelition in the inhabitants of the water very similar to what at present prevails. The cartilaginoms orders decrease, and are replaced lis usseons tishes, suth as the salmon, col, turbot. and herrim-tishes which are of much greater value to man than those they superscted.

FISH-HOOKS. A consileralle amount of skill is required for the suceessful manafacture of these simple articles. There are twokinds in the market, the English and the Limerick fish-hooks, the lattel are in the highost repute anong anglers. The Enclish tish-lomks are made chetly at Jiedditch, in Wureestershire. Sted-wire is cut into the required lengths, and softenel; then the ends of three of these are inserted into shallow holes of a sort of rest or standart, anel thus supported, the barls of all three tozether are cut up, by the skilful prossure of a stout knife: they are then pointed, and turned by pressing them against a little ridge of sheet-brass let into a hock of woot, aml haviner the requisite curfature. The other end is next thattened out, by lasing it on a small anvil, and striking a blow with a hammer. This is done to prevent the silk ligature from shiping over the end. The finer worm-hooks have the shanks tiled, in order that the silk dressing may not enlarge the shank so much as to prevent the slinping of the worm over it. They are then hardened, tempared, and lhued. The Linurick hooks are male by cutting the steel, which is male from the best malleable iron, into leugtbs for two hooks. The ends are then forped out to the shape of barb and point, and the barb is undercut with a dile from the solid forged end, instead of being cist and turned up with a knifc. This constitutes the chief superiority

FINHEG, ia l'hotogaphy: When a picture has beve whand throug the aseney of hight, ly the expentre of a sonsitive surfice sutably perbard, and the sulberpunt leveloment of the latent image, there remains in the decprst shatows of the picture a portion of the sensitive material, unacted urom hy light. The removal of this maltered sensitive material low apmopinte solvent, is termed fixime. theneh the terme flering would perhaps be peferahe, fixing heme more strictly acemate in the case of the lyunerreatyp process (q. . . . where the picture is literally fictel t, the silver-plate by the deposition of a lilm of motallic coll, of extrome tenuity, from a boiling hot solution of Sal D'or (ๆ. w.).

For particulass of failures arising from inmerfoct fixation on elearines see Phinting Proers.

Fi'XTUREN, in the Haw of Fogland, are those fersumal chattels ( $\mathrm{q} . \mathrm{r}$.$) which are let into the suil,$ or atherwise actually affixed to the freehoh; a definitiom which is sufficiontly aceurate to aftom a principle for the solution of the questions which arise hetween ladhorl and tenant as to the right of the former to retan, or of the latter to romovethet a principle, the aphlication of whith is attemaded with many practical difficulties. If the chattels he cntirely ciear of the soil, they are unt fixtures at all, and may be earicet of at phensure like any other species of persmal property: 'The general rale as to what constitutes a fixture legally inmuable is, that it mast lue either let into the earth, or cemented "r "thersise unitul tu some erection previously attached to the gromb, si that it would le waste
 fant it must bu remarkm, that a tenant may in all casus construct any erpection he ruay make in sumb in manner as that it shall not become a fixture. Thus, if hueven erect laildines-as hams, cranarios, sheds: and mills-upon blockis, rollers, pattons, pildars, or 1hates, rosting on brickuork, they may he mmomet, althugh they have sum intes the eromen ly their awn weight ( 16.46 ). To this mbe various exemp tions have locm made in favonr of what have heca
 burase of carryimen a trade: and the statute mon-
 arotiol for aurcultmal purpors. It is difficent to tate. the limits of the exception with wicrence to tradodixturne with any appowh to acenracy, The followint is furlapes as near an apmoach as the
varsing eiremastances of ench individual case whll ahait of. Whenever the following circumstansed wour, it may le contidently pronowned that there the tomant inay safly remove the article. Thos, things which the tenaut has dixed to the freehold fine the purpuses of trate or manufacture, may be Whern awa ly him whener the removal is mot contary to any prevailing practice: where the articles can le removed withont causing material injury to the estate, and where of themselves they were of a ferfoct chattel hature lefore they were put up, or at hant have in substance that character indequmdently of their uaion with the soil -or, in "ther words. where they may be removel withont lunge entirely demolished, or losing their essential tharactor or value $(\mathbb{I b}, \mathrm{P}, 46 \mathrm{~s})$ : see also the case
 Nurservmen have been allowed to renove trees and shmbs which they have planted expessly for praposes of sale, lout not to phongh up straw. herry-hels, out of the ordinary comse of managenut of the mursery-gromd. Neither can they remove hot-bouses, green-lunses, forcing-pits, or vther ercetions of that description; and in no case can priate persons sell or remove fruit-trees, though planted by themselves (Amos and Feraud on Fixtures, 343, od edition). 'The provision of the commo law of England with reference to agrieultural fixtures has been modified by 14 and 15 Vict. c. $\quad 35, \mathrm{~s}, 3$, which provides, that if any tenant of a farm or land shall, with the consent in writing If the landorl fur the time heing, at his own enst, erect any farm-luildings, either detached or otherwise, or pht up any other bulding. engine, or machinery, either for agricutural pirposes or for the fumposes of tanle ame agriculture (which shall not lave been prot np in parsuance of some whiqution in that hehalf), then all such bublding, conines, and machmery shall be the property if the tenast, and shall he removalle by him, notwithstanting the same may consist of sparate mahdings. on that the same, or any fart thereof, may be hailt in ur permaneutly fixed to the soil, so as the tenant making such removal do not in anywise injure the lane or buildines belonging to the landurd, or atherwise do put the same in like plisht and condition as the same were in liefore the erection of anything so removed, provided that no tenant shall be entitled to remove auy such matter or thing without giving to the landlord or his agent me mantlis provinus notice in writing of his intertion sa to do a aud thereum it shall le lawfol for the landord, or his agent, on his authonits, to elect to purchase the matters and things proposed to be removel: and the might to remove the same shall theredy coace amd the same shall belong to the laminmi: and the value therof shall le ascertained ly two rifrees, one to le chosen ly ench marty, (a) hoy unpire to be named ly such referees, aml shall be puid or allowed in account by the lamelord who shall have so elected to purchase.' This act is confined to Fmblame; lout in questions of fixtures, as Mr Hunter illserves, the common law of England having boen domed practically authoritative in Sentlum, the clanse affords valuable matter for consideration, as shewing what has been hedd advishle in Erglanl (Lomollorl ome Tenant. p. 990 , ab culition). las Sentland, it has heen customary, in acricultural lases more paricularly, to determine tho respective rights of lamelhor and temant by pration stipulation, amt. for this reason, fewer prints hane buct deceled by the conets than in Englaml.
As remals urban tenements, the rule seems to he, that the tinant may remove whatever he has fixed "! fur ornannot of dumestie use-e. g., hangings,
wainscot, stores, \&c, but not such rrections as hare become part of the tenement, and constitute permanent improvements. Thus, he camot remove a conserratory fixed to and communicating with rooms in a dwelling-house by windows and doors.

Fla'CCUS, C. Valemits, a Roman bet, who flomished in the Ist $e$., and is sumpsel to lave died SS A.D. Absolutely nothing is known rectarting his life. He is the anthor of an enic pomen on the Argonantic expedition, which in its extant form is incomplete, fome modern critics, Wawner among others, praise it extravagantly, and place the athor next to Virgil ; hut the more gueral opinion of sonwl scholars is, that the work is rather a specimen of learaed mediocrity than of gemuine inspiration. The elitio minceps of the Argoneutice apreared in 14\%. Of modern editions, may be mentuned those of Wagner (Gött. 1805) and Lemaire (Yaris. 1524). An English metrical translation was pmblislad ley one Nicholas Whyte as early as I-i., Similar translations exist iu French, Italian, amd German.

FLACOURTIACEE, a natural onder of exogenous flants, allied to Passion-flowers, consistiag of shrubs and small trees, almost exclasively confined to the warmest parts of the glole. Many of the slecies, particularly of the genus Flacoutia, produce ${ }^{\text {leasant, sweet, or sulach fruits. Fla- }}$ courtio inormis is much esteemed and cultivated in the Muluceas. Aroutto ( $\mathrm{q}, \mathrm{r}$.) is produced by a tree of this oricr.

FLAC, a popular name for many endogenous plants with sword-shaped leaves, mostly growins in moist situations. It is sometimes particularly apropriated to the species of Iris ( 1, r.), or Fluwer-de-luce; hut is given also very indiscriminately to other plants of similar foliage, as the Acorus calamus (see Acones), which is callerl Sweet Flag.
FhaG (common to the Teutonic languages, and derived from a root signifying to $\mathrm{H} y \mathrm{l}$, a choth of light material, eapable of being extended ly the wind, and desigmed to make known some fact or want to spectators. In the army, a dlacs is the ensign carried as its distinguishing mark by each regiment; and alsu a small banner, with which the ground to be occupried is marked out. In the navy, the flag is of more importance, often ennstituting the noly means vessela have of communicating with each other, or with the shore. For this pumose, devices of conspienons colours (usually black, white, red, yellow, or blue) are hoisted at the mast-head or at the gall. The flags haring three forms-viz.

1, the Square Flag; 2, the Pennant; 3, the Eurgee.
A very few patterns in each shape give suffieient combinations of three or four flars to express any letter or word in the lagnage. The tlag is also a sign of the rank of the prineipal persm on board a ressel, as the 'Royal Standard,' containing the arms of the United Kingdom, which is only hoisted when a member if the royal family is on board; the Anchor of Ilope, on it red ground, denoting the Arlmiralty; the rennant. which sprecifies the aumiral's squatron to which the ship belongs (see Flag-officer.) ; and the ensign, which denotes the nation.

The ensigns borne liy ships-of-war of the leading
states of the world are as shewn below (in these diagrams, the direction of the linus shews the colour, as in heraldry), viz. :

Flars of the Principal Maritime Nations:
 biue catien; t, fance; 5. linsua; 6 , 1 tu-cha; 7 , Itals; S. Veloum: 9. Hotumd; 10 , Au-nla; 11. Enited States;
 mak; Lí, Erazil ; 1), Eiccuen.

A white flas is accepter throughont the world as a token of deace: a red flay as defiance: and a black Hag denotes a parate: a fag of ilain yellow usually signifies that the ressel bearing it is in quarantine. Sue also C゙shos Jack.

FLAG OF THE PROPHET (Sanjak-Sherii) is the sacred hanner of the Mohammedans. It was originally of a white colour, and was composed of the turban of the Koreish, captored by Mohammed. A black lag was, however, soon substituted in its place, consisting of the curtain that linng before the door of Ayeshah, one of the Prophet's wives. This flag, regarded ly the Mohammedaus as their most sacred relic, first came into the possession of the followers of Omar at Damascus ; it afterwards fell into the liands of the Abbasi ; then passed into those of the califs of Bagdad and Kahira; and, at a later period, was brought into Europe by Amurath III. It was covered with forty-two wraplings of silk, deposited is a costly casket, amb preserved in a chapel in the interior of the seraglio, where it is guarded by screral emirs, with constant Irayers.

 ince. The immediate oceazin of this new rmathorst of fanationom, was the terror which [ervadeal suciety daring the dreadma phatue limown as the back Weath, whichs Hecker, in his Efpidnies af the Miedle A!ys, westihes with terible tidelity. The same extromances were again repatol in Luper (iermany, the porinees of the lihim, the Netherlands, Switzorlami, swelem, and even Snghanl. Although rimumaly exclamed from Franco, these fanaties dhectal in catrawe into Avignon, then the residonee of the pryes, whon they were condemned ly a lull of chment V1. The mania gradually
 of it till the legimming of the next century. In the year 1414, a now tron of flagellants, locally called Flypor, made their aprarance in Tharingia aud Luwn kixony, remwing and even exaggerating the wihnst extravaganes of their pertecessors. These now fanatics appar to lave rejected all the receivel rolumis usigus, ami indeed all extermal wowhy, lhacing the or wtire reliance on faith and - Hagelliation.' "Their bealer was called Comrad大elmint. They rejucteal mot unly the doctrines of the chureh muin the sacruments, hat also purastury and payers fir the eleas. Schmilt pretemed a divine mission: and proclamed that the houd of Hagellation was the true wehling-garment of the gospel: that it was more precinos than the how of the matyrs, and a sure 1 masort to cternal lite. The riolence of these fimatics drew upmon them the severest paniments of the Inquisitom. Many, if them were apitally oondemed, and schmilt himself was burned at simgerhansen in 141. Their dontrines, comprisel in lifty articles, were condomned in tha Conneil of Constanec.
These strange extratagances are reprobated by the Joman Catholie Clurch in emmon with all other ('hristian communties; lout Roman Catholies (relying on J Cur. w. $\because-$. Coloss. iii. 5) hod the lawtulness. and evan the meritorious eharacter, of ruhurtary self-chastisement, if mulertaken with due dispositums, practised without astentation or fanticism, and animated by a lively fath and a firm hope in the merits of clarist. This is the selfecanturtion known under the name of the Dnscipline - - a form of mortification not unfrequent in the monastie state, and eren practised by lay persms, ant these sunctimes of the highest ramk, lwth in ancient and in molem times. Compare
 Waldines Annates Minorum Fratom, Liayndilis Comtinuntion of Bormius. Mosheim's (Murch'llistory (summe' id.), Gieselor's Kirhengerhurhe Dlilman's Lutin Christunity, amd Wetsir's $k$ irchen-Lexicon.

FLAGEOLET, a wind instrument with a mouthphece like the common whistle. It is made of hoxwowl or ivory, in sereral pieces, and has lndes for the fingers, like the flute. According to Burnes, the thageolet was invented by Nieur Junigy in I580.

FLAGEOLET-TONES is the name given to the harmmine motes of the violin, violoncedo, and other strimed instrumants, which notes are produced by the fing r lightly tur hing the string on the exact part wheh wnerates the harmony, and mot by pressing the strmg dewn to the finger-board. The string
vibrates on both sides of the fingur, the long side dividing itself into prats of the same length as the short sille. See HARMosis. The inventur of the manner of playing tlageolet-tomes is sanid to have been Domenien lerrart. The best work on the subject is by C'ollinet.

FLA(ANTONE, a rock which sulits into talmular nuasses, or tlays of varions size and thickness, in the original plains of stratification. Flarstones are acherally sandstones, combincel with nore or less armillateons ur calcareous matter; some, however, are indurated elays, aml uthers thin-bediled limestones. They are used for paving, cisterns, \&e. The most fanous are those of Fustiniog (North Wales), remarkable for their larme size, even grain, and great beauty; those of Yorkslige, also of lurge size, and of great hardness and toughness: and those of Caithoess, which are extremely tomgh and durable. The Caithness Hacss belong to the Ohd Red Samlstone; the Yorkshire are taken from the millstone grit division of the Coal Measures.

FLA'MBOROUGHI HEAD (Saxon, Fleamburfh), a promentury of the Yorkshire const, and forming the northern boundary of Bridington Bay. It temminates a range of white perpendicular chalk cliffs, 6 miles Fong, and 300 to 450 feet high. Its rugged sides contain many caverns, and in the sea near are picturesque chalk rocks, which swarm with sea-hirals. The chalk contains fossil sponges, crinoids, \&c. On the lleal is a lighthouse, ollt feet high, seen 19 miles off, and in lat, $54^{\circ} 7^{\prime} \mathrm{N}$, and long. $0^{\circ} 5^{\prime} \mathbf{E}$. Across the peninsula, ending in the Ilead, runs a litch, with two lines of defence and breast works, ealled Dane's Iyke, lout really an ancient British work.

FLAMEOY'ANT, the latest style of Gotlic architecture which prevailei in France It mevailed there during the lioth and part of the listh centuries, and corresjonds to the lerpendicular (i.v.) in England. The name is derived from the tiamelike forms of the tracery of the windows, finels, \&c. (fig. 1). The characteristics of this style are

Fig, 1.-Window, Hartleur.
mimute and elaborate ornament, comhned with general bareness of surface. 'the crockets, for instanee, are generally cut into a great number of small leaves, while they are placed far apart the mouldings are divided into large empty hollows,
and small thin tillets anul locals; the finials have crockets minutcly carvel, set mpon bare inramidal terminals; the areh-moundngs are dividet into a great number of small parts, aud want the
hooldness and decision of the earhier styles. These mouldin!s :re frequently abutteci un the pillars, or continuel down them with(out any caps: and when there are cups, they are small and withonit effect. Nee lig. ©. When mouldincs join, they are frequently run through appear to interlace. The effect is mutricate rather than beatiful, suggestive, like the rest of the style, of ingenuity in stone. cutting rather than iort. The dnorways and windows are
 sometimes large and fine (as in tig. l); hut while these are highly enriched, the general surfice of the buiding is left ton plain, There are many large buildings in France executed in this style, but it is uswally portions only which are line, not the general eflect. Some of the spines of this period are also very beantiful. The north spire of Chatres C'ithedral, fur example, is consideren one of the finest in France.
 or burning Orelinary combustion consists in the oxygen of the atmosphere combining with some combustible substance so mpinly as to give out light amt heat. When the combustible is either origimally a ras, or lecomes so liy the heat, the combustion takes the form of flome. Flame, then. is the burning of a gas. Th must cases, the gas of flame is a compomb of hydrucen mal earlon, with minute particles of solitl carlom suspembed in it, and is formed from the fuel (conl, tallow, \&e.) being decomposed by the heat. The heat and light of flame vary with the gas: hydrowen proluces great heat, but little light. The lighing power of a gas depents upon the froportion of carbon it contains, the particles of which becume glowing hot before being couswmed.

The flame of a lamp or candle, or simple gras-jet, consists of a hollow cone, in the centre of which there is no combustion. The central space appears dark only by contrast with the luminous cone which smrounds it, It consists, in reality, of transparentinvisible componnds of earhon and hydrogen, which are constantly rising in vapour from the wick. If a glass tube, "pen at hoth ends, be lielul obliquely in the flamo of a camile, with its lower extremity in the darle central splace above

Fig. 1. the wick, it will comluct away a portion of the cominstible riapour, which may be kinder like a gas-jet at its npper emel, as represented in fier, 1 , This dark portion of the flame may be called the urau of no combustion.

The luminons cone which envelops the dark space is the area of partial combustion. The oxygen

FLAMI NHAN WAY (Jín Plominia), the great northern road of ancient 1taly, lealing from liome to Armimm (IRmimi) on the Adriatic. It was constructel by C. Flaminins during his censorship (2020 f. © ), and was desimed to secure a free communieation with the recently convaered Canlish torritory: The F . W. was ase uf the most velehrated and most frequentel rouds of ltaly both durins the period of the Romblie aml of the limpine Its importance may he estimated from the fact, that when Aurnstus ( $2 \mathrm{D} . \mathrm{C}$. ) apmonted fursmis of consular dimity roul-survevors fur the cthor highwas of his cominims, he resured the cane of the F. W. for himself, and renewed it themghont its whale length. Its general direction was horthomy, Leaving Reme, it kepe for the most part at mo ereat plistance from the Tilere till it raturei Narmin (Normi), where it struck off in a north-eastorly direction, baswing Interama (Termi) and Spoletium (Mpmpto am reaching the foot of the Apmanes, at Furum Flaminii. Crossing the central allpe of the -hemmines, at All Linsem (La

Schieggia ?), it again proceeded in a northerly direction, pursuing much the same line of route as the modern road from Fulimo to Frano, and readied the Adriatic at Fanmm Fortune (Fano), whence it wound along the cuast to Ariminum (Itimini), where it ended, or rather where the name ceased; for the Via Amilia (see Emintan Irovinces) was just a continnation of it. The whole length of the mad from Iome to Ariminum was faccording to the Jemsalen Itincrary), oxemiles, and acording to the Antonine, 210 miles. Remains of it still exist at various places, and assist the antiquary in traving its direction.

FLAMSTEED, Jonn, the first astronmer-royal of Enclinal, for whose nise the Fioyal Observatory at Grenwich (ealled Flamsteed House) was built, was born near Derby, l9th Augnst 1040, and early devoted himself tw mathematical and astronomical pursuits. While yet a youth, he mastered the theory of the calculation of eclipses ; and his calculations of some remarkable eclipses of the mon were the means of intrulucing him to the notice of the eminent scientific men if his time, amons whers to Sir Jonas Moore, then Survevor-genemal of the Ondnance, through whom, and in connection with whose department, he was appointend astronomer to the king in 1675 . The year following, the observatory at Greenwich was built, and F. began that serius of observations that constitute the commenement of modern jractical astronomy. He formed the first trustwortly catalngue of the fixed stars, and furnished those lunar olservations on which Newton depended for the verification of his lumar theory: Extracts from the papers of F., foum in the Ohservatory by Mr Francis laily, and puldished ly authority of the Acmiralty in 1535, brought to light a very sharp quarrel that hat taken place letwen F. and Newton and Halley with regard to the pmblication of the results of F".s labours. The Mistoria Crelestis Britannica, his great work, in three mols., giving an account of the methouls and results of astronomical observation up to his time, was begun to be printed befure his death in 1719, luit was not pulhished till 1720. It may he mentioned that F ., white following his scientific pursuits, qualifiei himself for lonly orders, ant in $168 \pm$ was presented to the living of Burslow, in surrey, which he held till his death.

FLANCHES, or PlaivquES, in Heratry, are compensed of archeol lines drawn from the ipper anders of the escuteluen to the base prints. The arches of the flamehes ahmost meve in the centre of the shided. The Flanches are an ordinary little useal in Scoteli heralelry.

FLANCONNADE, a theust in Fencing (q. v.).
FLANDERS was formorly the name of an extensive amb amost imberabent territory maled by 'counts, aml 'mblmacing, besides the present Delgian provinces of the sanm name, the southern portion of the province of Zabland in ITolland, amd sime of the cheprormonts in the borth-east of France. Cresar formi this instrict mhabiton ly the Morini. the Menapi, and the Nervii, and having congucerd these tribnes, he ampeal the comatry. Under the rule of the Franks, the river Sclacklt, which flowed through the district. formed the bomdary line between Nimstria and Austrastia, in consefuence of which the mothern and sumb-western part of the territury compised under the term F., although its pepulation was decintedy Germanic, came to belong to France, while the south-east, although to a lare extent non-Germanie, was after 1067 included in the German Empire. F. whtained its name from the I"kindergan (pagus Flondrencis, the district around Bruges and Sluis), whose counts
had heen made wardens of the nortl-eastern coasts of France at the periol of the incursions of the Normans, in the latter balf of the 9th c., and who extended the name of their hereditary possessims to the whale district which they governed. The first count or markgraf of the conatry is said to have becn Baldwin, surnamed Pras de Fer (Irom. Arm), who married Julith, the daughter of King Clarles the Bald of France and witow of Ethelwulf, king of Englad, and afterwards received the newly created 'mark' or county, in sta, as a hereclitary thef fiom his father-in-law. IIe extemiet his territories loy the addition of Artois, which was held by his successors until lhiliple Auguste remaited it to France. He djed in 579 , lout not until he had inausurated the industrial greatuess of F by introdueing into it a great nmmber of workmen skilled in the manufacture of wowlen and other gomes. Ballwin 1V., or the Bearded, one of the successors of Badwin Bros de Fer, received in ficf from the Emperor IIfenry II. the burgraviate of Ghent, Walcheren, and the islants of Zeadand, and thus became a prince of the Cerman empire. Il was succeented by his son Ballwin $\mathrm{Y}^{\circ}$, or the I'ious ( $10: 36-1067$ ), who increased bis passessions by the addition of the German territory hetween the Seheldt and the Dender, lelonging to the duchy of Lower Lorraine. To this he adelel Tournar, the supremacy over the bishopric of Cambray (to which, till the erection of the new bishopric of Arras, the county of Flanders had heen ecclesiastically sulmolinate), anel the county of Hainalt. During the Midde Ages, F. figured prominently in the political attairs of Europe-the counts of F. being more powerful and wealthy than many European kings. Baldwin IX., the foumter of the Latin kinglom at Constantinople, died in loug. leaving two danghters, one of whom died without ehildren ; the other hequeathed Hamanlt to John of Avennes, her son hy her first marriage: and F. to Chy lampierre, her son by a secomil marriage. Meanwhile, the industrial prosperity of the cities of F. han become so great. that the citizens began to feel their own power, and to claim independence. They formed repuhtican communities like the free cities of Ciermany, with this difference, that they armitted the nominal suzerainty of the comots. But they were not afrajd to take up, ams in defence of their lilerties aqainst their unminal masters. Witness the iusurrection headed ly Jaki, van Arterelle ( (1. r.) against the cru+l government of Count Louis I. On the marriage of Marguerite, the daughter and heiress of Louis 1I., Count of Flanders, to Plifip the IBd of Burgundy, the comatry was united to the Bughudian territories in 1384, and afterwards shared the fortunes of that duchy. The dukes of Burgundy brought great part of the former duchy of Lower Lorrane under their dominion, and thris laid the foundation for the sulisequent union of the states of the Netherlands, in which F. continuel to form one main emmponent part. On the death of Clarles the Bold, these territories passeti, in $147 \%$, to the House of Hapslurg, hy the marriare of his danghter Mary to the Areluluke Maximilian. After Burgundy haid passed with King Philip Il. to the Spanish line of the Ilouse of Hapshorg, the territory of F. was considerally diminishet, as not only was the fortion called Dutch Flanders transferral to the Estatesgeneral by the pace of Westplailia, but, in the time of Lous SIV., France seized upon another portion of F․, as alse a part of Hainault, Camabray, and Artois, and was contirmed in lier posscssion by the peace of . iix-la-Chapelle, of Nimeguen, and of Utrecht. liy the last, and by the treaty of peace concluded at liastadt, the remains of the Spaninh Netherlands again fell into the hands of the House

 Hainault, os the 11 . Dy that of West Flanders, and on the X. ley the Dutch province of Kealiand. It

 of the mont lmlulnus cenmetry in Europe fece bibuiss. It is waterel mainly hy the scherht, and loy its attluents the bys am the Dember. The surface is haw and level. The suil has heen rendured axtromely fortile liy means of spate cultivation and an excellent maniring system. Besides the ordimary varpeties of cram, jutateses, flax, hemp, and hofis are proluced in wreat quantity. The district in the rarth-rest if the provine, latween the tuwns of Intwory and thent, is endebrated as a daxyrowne phanter. The manfactures are chictly Tace, tanarks, linens, woullens, lumbin-nct, silk, ant corlage : sugar-refining, brewing, and distiling are alson carrint on. Chicf towns, Ghent, Alust, and Dembermmate

FLANDERS, WEst, the most western pranince of Bublim, is lumaded on the N. ly the North Sien. and on the Wh. and s. ly Franee. Its area is 1237 square miles, nul its pripulation in $155^{0}$ amonntal t. 665976 . Its chicf rivers are the Lys and the Iscr: lhat it is waterel ly mumerons smaller streams, and is intersected i,y many important connis. Its surface is flat, with sandy linls in the sonth and along the evast; and its sibl sanly, Dout well cultivated and prolnctive. It has fewer prolucts and manufactures than East llanders. Chicf towns, Bruges, Courtrai, and Witeml.
flancte a rim or projectimu man a tulve or eylinder of mital or uther material, th serve as a haringe "r aftiod meanc of fixing it: for cwample, the projecting rim on the tires of the wheels of railway carraturs is called a flange.

FLASK (the side) a word nsed in many senses in military matters. Fhonke of on ormy are the wings, or loolies of man ma the riflut and leit extromities, preppared to chuse in upen an chemy who shall attack the centre. Fomk filk are the suldiers marching on the extreme right and loft of a company or any other body of tratis. Fomk cumpuny is the conipany on the richt or left when a battalion is in line; the grenaliser and licht infantry companies usually ocenpy these positions, and are known as thank companies, whother wath the remainder of the retiment or not. A flunking yerty is a bouly of hurse or fout employed in hangins unn and harassing the Alank of an enemy's force. - Flank, as applicd in Firfificiation, will be best descrin+ul under that artiens (l. v.). The flunks of a fimmerir are certain salient F"ints in a mational hondary, strome by nature and art, and ordinarily projectiny simo what heyond the genc al he. The effect of these flluke is ti, protect
tho" whole frontier against an "nemy, as he dare nut furbetrate lotwen thom, with the risk of thatir carrisens. winfured from their own territories. attacking has rear, and chtting off commonioation butwech him and his base. Silistra and Widm wore thanks of the Turkish frontier during Omar t'asha's eampaign in Is.3 and ISont. Similarly, in the went of an invasion of England from the cuast uf 心ussex or Kint. l'utsmenth and Chatham whath lae fommatile flankum garisons. which whal almant mecessanily hask to la sulnhand before the invaler coud marely on Lention.
Ha ewhotions, 'to hamk' is to take smole a prosition with troups as "ithere to ahl cmene onn army in an attack on the enmuy, ley leading the latter to sulpuse that his tlanks are in danger in his present |"sition. on to prevent him from inlvanciag on one's enmrades by threatening his thanks if he should do sn. To omtitank is to suceed by manceurres in eom. manding the thank of an cmemy who has been, on lis part, ewheroming to flank une's own force.

FLANSBL (Wedsh, grlemen, from gheth, woul, allied to Lat. (unct), a wiodlen fabsic, dillerimg from lrombenth am most , ther womlen falries in being woven of yarn more loosely twisted, and having less dressing. "Tlue loest flannel is male in the neighbourhoril uf Wilshanel amd Sewtowa, in Wales, from the won of the Welst mountain-sheep, and is commorcially known as Welsh tlannel. Large quantities are also marle in West Laneashire, West Forkshire and the meighburhond of Leeds, A more elosely spun min woven flamel, used for ericketing and rowine slirts, \&c., and dyed and printel with varions mours and patterns, is made in the west of England cloth-making district, in the vicinity of strond, in flowestershire. Fine light thamel of this kind is mate in lrance and helgiman; some of this is twillell, aul apyroaches nearly in quality to French merinoss, hat is much softer. The ifmand fur this sort of fancy-shirtiny flimnel las of late become consideralle, and has led to the production of many varieties, which, thumgh bearing the mame of flannel, vary so materially from the original Welsh dlamel, that they ean scarcely be includel with them under any general definition. (barse hamel, callul Gethequs', is male in Ireland, and is chictly used lyy the peasantry of the country:
FLAT, a masical character, shaped thus $b$, which, when phaced before a mote, lowers that note balf a twne. What placed at the leghiming of a piece of music, it denotes that all the notes on the line or sinee on wheh it is phaced, with their octaves above and below, are to le phayed tlat.

FLAT.FISII, a popular name of the fishes of the family Plenronectilla (II. v.), as the flominder, plaice, sole, turbot, halinut, de: : which have the loody much compressel, and the sides unsymmetricai. swimming on one sile. It is sumetimes extemdel in its signification so as to inclade skates and other fishes of tha Ray (I. . .) fimily, which are very different, heing cartilagimons fishes, guitw symmetrical, and swimming in the lwhy, although, like the Pleurometide, gencrally keepong close to the luitom. It is never applical to the minch compressed symmetrical tishes, such as the dury, which swim ii the ordinary prosture of fisthes, the dorsal edgo upwarls, the rentral dnwnwards.
FLATTERY, CAPE, a healland of Washington territimy, on the Pacific cunst of the United Sitates, marks the sonth side of the entrance of the Strait of Juan de Fuca. It is in lat. $48^{\circ}-4^{\prime} \mathrm{N}$., and in long. 12. $4^{4}$ 40,-Ancther headland of the same mime is foum on the cast coast of Australia, in lat.
 to the north of Emindewur Bay.

FLATUULENCL, distention of the stomach or bowels ly the gases formed during digestion. See Indigestion.

FLAVINE, or FLAV]N, is a yellow coloning matter cmployed in dyeing, amd impurted in the combition of extract. It is mulerstond to be the colonring matter of bark (yupreitron hark), and is useal in place of quereitron hark. When treated with loot water, flavine yieluls a ycllow turbjel sulution, which, on settling, leposits a yellow-brown 10w ler. When employond in dyeing, the doth is tirst treated with an aluminous mordint (sere ('sbocophavisc) ; and on siflosequent immersion in the solution of flavine, a fine yellow colnur is fixal on the eloth. The eolouring power of the extract tlavin* as imported is so great that one moner is erian in alyeing qualities to one promid of puereitron bark.

FIAX ( f imm ), a gemus of plants eomprisiner the sreater part of the natm:ul mrer Limere"; an exogemons oriter alliest to ferumidecor and thedider, anıl consisting of ammal and peremial herbaceots plants, with a frew small shruls. There are about minety known species of this order scatteren over the blobe, but most abumant in liuroje and the north of Africa. Their leaves are simple, entire, without stipules, and gencrally alternate. 'The Cummon Flax or LiNt (L. usthetissimum) is an

Common Flax (Linum usitutissimum).
anuual : a mative of fergipt, of some parts of Asia, ane of the south of Eurne, not truly indigenons in Britain, although now naturalised, and often oceurrime in cornfichls, which is the case also in many parts of the world. The must common variety of the flax plant has a very slender erect stem, two or three feet hish. laraching only near the top, so as to form a lonse corymb of thowers. The leaves are small, elistant, and lanceolate; the flowers of a heautifnl blue, rarely white, rather brualer than a sixpence; the petal's slightly motched almg the margin ; the sejals ovate, 3 -nervel, ciliatel, destitute of glands; the capsules searcoly longer than the calyx, not bursting open elastically, but firmly retaming their seteds, which are dark horwn, glossy, waloblong, flattenerl, with acute elges, pinterl it one enf, aml abont a line in longth. Another variety, hoswever, is coltivated to some extent in many parts of Europe, su different, that some lootanists accoment it a distinct speries ( $L$. humile or $L$. crepi(uns), which is less tall, is more inclined to branch, and is partieularly distingnished by its eapsules, twice as long as the ealyx, and bursting open
clastically when rine. The sceds are also larger and paler. This suricty is callad spmathen imb Elatiplein ly the Germans, the one name referring, to the clastic hursting of the easules, the other to the sound which acompanies it. The former variety is known to them as Hiubrelve, being often sown in the cul of antumn in eleraterl listricts where the smmmer is too short for sping-shwn flax, aml also as Schlieszlein amul Drowhlion, from its close eajsules and the thrashing neciled to seprate the seed. The sprimelein produces a finer, whater, ant softer filme than the other, hat shonter, anl it is therrfore not sar extensively eultivatecl. 'Thare are many sub-varieties, to which ame their diffirent qualities no suelı attention has luen pail, in Jritain at least, as to those of other important cultivated plants.

This plant is highly walnalde both fur the fibres of its imacr lark and fur its seeds. The dibues of the jmer bark, when separatem both from tha lank and from the inner wosly purtion of the stem, are Finx or LixT, the well-known material of whish lanen thread aml choth are made, and nsed equally for the finest amb for the coarsest fabrics, for the mont dilicate candric or expuisite lace, and for the strongest sail-choth. The seeds yiell hy expression the diming fixen oil ealled Lisseen Gil, su jumch usel for mixing paints, making vomishos, \&e. whilst the remaining crushed mass is the Linseed ('akr, or Oil-take, greatly estecmed for fecting cattle, and when ground to a tine fowder, becomes the Linsefi Meal so useful for pualtices. Linscenl is sometines nsed in medicine, as an emoliont annl demuleent in irritations of the pulnmary and of the minary mgans, and of the mucoms membranes tenerally, during its value for this purpore from a menclage which it contains and which is extractel? by loot watter, makiag linsicel tor. The tilare of flax is the ultimate material from which paper is made. and linsect oil is used in the mannacture of printers' ink. No plant nut yielding fore is more useful to man than the flax plant.

It has Inen cultivatel from the earliest historic times. It is mentioned in the book of Exodus as one of the proluctions of Egyit in the time of the l'haranhs; and it has been recently aspertained by microsengic examination, that the cloth in which the monmies of Egyt are enveloperd is linen. Sulnmon purchasol limen yarn in Eypht. Herolotus speaks of the great Hax trank of begyt. Creat quantities of llas are grown in that country at the present day; its coltivation is also very extensively carried on in some parts of Europe and of North America. The propurtion of thax to other crops in Britain is probably smaller at present than it was at a former feriod, lat an increase of its cultivation has lreen strongly recommented by jorsms where opinion is entitled to great regam, and partimulaly in lrelam, where however, it is mome extmaively cultivated than cither in England or certhand. It las the alvantage of giving employment not only to an agricultural but to a manufacturing populition. Flax is more extensively and more sucessfully cultivated in Belgimen than in any other Enropean conntry, particularly in fonthern Brahant, Hainault, and West and Eist Flanders, in which the most beantiful flax in Europe is mrotucal, cmployed for the manufacture of the famous brussels lace, and sold for this purpose at about thoo to es 150 pre ton, the erop when jwared for the narlect sometimes excecding in ralue the Land on which it wats promberl. The village of lielreque is distimguished fur the production of this precious tlax. The gratest care is bestowed on its eultivation, ame to this its excellence is probahly in a great measure to lee ascribed. Not a weed is to be
 of pardening. flas is cxtoucively grown in the comitries on the sontluern shares of the biltio, ame forh the fibue and sect are largely impored from them moth bitan. lbesides the hax rased at hame
 Quns, dresicel :and matreserchl.

Flix has bean cultwated from time immenorial, as a winter emp, in Imhia, hat miy for its somi, and nut at all for its tibre. This remarkible circhmatance is supposed by lor longle to be uwing to the existence of the conton phint in that contery, the titore if which nore ratilly uliors itself to view on the hursting of the pred. Hut hr lionle also states his "pinion, that the elimate of the wreater part of India is masuitable for the pathertion of the fibre of flax: and the varicy a ultaratel in India is mey akout is foot on bixhten inches in heicht, much luanched, ant ridhun a very worthless filore, whitet it is loaded with capsales, and the seeds wich a larger fraportion of ois than those of flax yrown in Europ It is sumctimes sonn as an tasine arsmand fields.

Thuh lepermes on the thickness of sowing. Flax must be sown thick to sied at fine fibre; but when intembed to pronluce a filme fur coarser purposes, the dants ought to hase mose rom. For the finest filire, also, they must be pulled before the seed is ripe ; lnt a coarser fibre and a crop of linsed are often much to he proferred by the farmer. The crop is alrays melled up ly the roots.

The dmminshed enltivation of dax in Britain, after agrienlture began to improve, is to be ascribed in part to the prevalnce of the pinion, that it is a very exhausting crop for the land. This has been said to be particularly the case when the seed is ripened. But the introduction of new manures has renderel this ohjection less impertant than it formeny was; and it has been found that the refuse of tlax itself is not a bad manure, and that the water in which it has been steeped is a good lignid manure. The water of Hix-stecping pits or ponds is often strong enough to kill the tish of rivers into which it is allowed to now.
The capsules (bolls) of nax are torn off, after it is pulled, ly a surt of combing called rippling (sce Flax-dresscic). Great care is requisite to dry them, and to keep, them perfectly dry. For the sulsequent processes, see Livisemp.
besides the enmmon fax, several other species are oceasionally cultivated for their filse, but are eonparatively of very little value.

The Limereve are, in reneral, plants of elegant appearance and with thowers of much beanty; some of them have flowers larger than common 1lax, and some are not unfrequent ormments of our green-houses. Radiola millpgram, All-sech, is one of the smallest of Dritish phanerogamous 1hants.
Pergivg Flax (Iinum cuthemticum) is a graceni little anmual with brauching stem, oqposite leaves. and small white dowers, eommon in tields amd meadows thronghout britan and most parts of Enrope. It possesses furgative and dimetie properties, owius to the prosence of a substance which has been called limin. Is a domestic medicine, a handful of the fresh horb is often administerem. infused in whey; and it has a $l^{m p u l a r}$ reputation in rhemuatism.
Flad, New Zeadayd, a valuahle fibre 'puit, different from common flax, and whtanel from the leaf of an endogenous, insteal if the stem of an exogenous plant. The plant yichling it is lhommin tpace, often called New Zealamd llac, amd sometimes Flax Lily and Flax Bush. It helonge to the matural order Liliacece, and is a percunial phant, a native
if New Kabliand and Norfonk Island: its leares Premalhe thase of an lris, are from two to six feet lonse and one to two ar thre inehes broad. The Homes ane probluced in a tall bramehed paniele; ase mumoras, hrownish yellow, not very beautiful; the fruit is a thrececomed capsule with numerous compresseal jet-hack seals. The tibre of the leaves is both very fine and wry strong, and was used hy the New Zalamlers, before their comotry was discovered by Euroleans, for making dresses, ropes, twine, mats, cluth, \&e. New Zealaud Flax is

New Zealand Flax (Phornium tonax).
imported into Britain for making twine and ropes; and the plant is cultivated in its native conntry: lts cultivation has also been attempted in some parts of Europe; but the winters of Europe, except in the sonth, are too cold for it. To ohtain the tibre, the leaves are ent when they have attained their foll size, and usually macerated for a few days in water. Hut the Neir Zealanders mocure the filme in its greatest gerfection, very loug and slenter, shimins like silk, by a more laborions process, and withont maceration, removing the epremis from the leaf when newly cut, senarating the fibres by the thomb-nails, and then more perfectly by a comb.

The ronts are purgative, diuretic, sudorific, and expectorant; a gom substitute for sarsajarilla.The leaves, when ent near the root, cxude a viscid juice, which hecones an edible gum. The New Zealanders grepare a swect bevage from the thowers.
PLAX-DRESSING, When the seeds aro beginning to change from a grcen to a palo lrown, is the best time for puling flax. Where the erop grows of different lengths, these lengths slowhit lie pulled and kept separately, uniformity in this respect being of great valuo in the afterprocesses.

The procuss first gone through after pulling is rinuling-which cousists in tearing off the bolls by
pulling the stalks through a series of iron teeth 18 inches long, placed within a distance of half an inch of each other. These are fastencl in a block of woot, which is phacel at the end of a plank or lones stoul on which the operater sits.

The next process is to obtain the flaxen firre or lint free from the wooly core, or boon, of the stem. This is eflectet by stecping the bundles in water till the boon begins to rot, in which state it is readily scparated from the fibre. The operation is called rotting or rettings, and requires to be managed with great care, as loy continuing it too long, decomposition might extend to the fibre, and render it useless; while by discontimuing it ton som, the selaration could not be effected with sufficient case. 'The time is generally determined by the nature and temperature of the water, and the ripeness of the flax-decomposition taking flace more rapidly in soft stagnant water than in rumning streams in which the retting is sometimes conductal. After leing suthiciently steeped, the Hax is sprean out on the grass, to rectify any defect in the retting, and niltimately to dry it for the breaking. lin some districts, it is the practice to conduct the retting cutirely on the erass-a process known as dewretting, in contradistinction to water-retting. This is a safer am less offensive methon, hat it requires much longer time, and in a country where land is valuable, would become very expensive. Un the whole, the mixed method of retting is preferablethat is, to steep, till decomposition of the boon is well alvanced, and then to complete the process on the grass. It has been attempted to separate the tibre ly machinery, without subjecting the tlax tin retting; but the article so prodnced has hithertu been rejected as inferior in quatity.
To avoid the delays and uncertainty depentent mpon the old processes of retting or watering, plans have been reeently introkucel, loringing the epera. tion more under control, like the other processes of our manufactures. The methods which have been adopted, aml are now working with success, are known as Schenk's and Watt's. By the first of these, the flax is placed in rats, in which it is kept down by means of strong framework. Whater is allowed to pass into the vats, to become absorted by the Hax ; steam is next abmitted, till the tem. perature of the water is raised to, and maintained at, about $90^{\circ}$. Acetous fermentation ensues in a few hours; and after being maintained for about sixty hours, the decomposition of the gummy or resinons matter in the stalk is completed. The mucilage water is next witherawn from the rat, and the flox taken ont, separated and iried either in the open air or in desiccating rooms, accorting to circumstances. In Watt's prucess, the flax is placed in a chamber provided with a perfurated false bottom; the top is clunble, and filled with water to aet as a condenser. Steam being atmitted to the case, the first result is the freeing of the flax from certain volatile oils. The steam rising to the top of the chamber is condensed by contact with it, and falls in showers on the flax beneath-a decoction of the extracted matter is thus obtained. In 36 hours, the process is completed; and the flax taken ont, is passed between rollers in the direction of its length, which presses out the water and decomposed gim, and splits and flattens the straw. By this process, all that the plant takes from the land is saved-the seeds being available as food for animals, and the chaff and refuse water as manure.
lrepared ly cither of the plans, the flax is now ready to be freed completely of its wondy particles. This is effected by scutching. Previous to this, however, the flax is passed through a brake or revolving rollers, in order thoroughly to crack the
boon. The brake, worked by manual labour, consists of a frami, in the upher side of which are a number of grooves; a morible piece is hinged at one cod, and provided with a smalar grooved piece on its lower side, lunt so placel that the projections pass into the hollows of the lower. The tlax, paced between these, and struck by bringing down the hinged part, is broken, but the fibre remains unimjured.
In the flax-breaking machinc, the flax is passel through a series of horizontal thated rollers; the fintes do not touch, thus preserving the fibre while breaking the boon. In continental countries, scutching is almost invariably performet by haul, the flax heing led in a gronve made in an uright stand, and struck by a flat bude. Nachini-scutching is nuld more certain and experlitions than hamsentching, and is, in consequence, fast superseding it in this comory. After passing through the Ireakins-machine, the flax is suljecter to the action of a series of knives, attached to the arms of a vertical whed ; these knives strike the flax in the lirection of its length. The process is sune through three times before the flax is ready for the markiet. Although machine-scutching is expechitions, it is nut capable of that pliant adipitation to the rarying nature of the tlax to be operated upon, which is obtained in hanl-scutching. The effect of mathinescutching is to produce tineness by reducing and impairing, rather than sustaining, the character of the filire-namely, the length and tineness of its 'staple' or fibre. To remedy these defects, seutching by means of revolving brushes lias been introtuced. This diviles the fibre without tearing it. The subsequent manufacturing operations will be notieed under Linen Manufaetciee.

FLAMMAN, Jons, the greatest of English sculptors, was horn at York, 6th July 1-55. It the age of 15 , he became a stutent in the Finyal Academy, but never worked in the studio of any master. In 1782, he married Miss Ann Denman, a lady of superior gifts anl graeos, who soon began to exercise a beneficial influence upon his studies. Accompanied by her, he went in 1787 to Italy, where by degrees. he attracted the attention of all luyers of art. This was still more the ease after his return to London in 1794. He was elected an Associate of the Lioyal Academy in 1797; Royal Academician in 1800; and, in 1810, was aprointed Professor of Sculpture to that institution. After the death of his wite in 1500, he withdrew from society, and died 7th December 1820. F.'s most celebrated works are his 'Outlines to Homer's Olyssey' (Fiome, 1793), and 'The Iliad' (Lonel. 1795), and his illustrations of Dante and Aisclylus. Many of his works display wonderful grandeur of composition, and a pure and noble style. He was one of the first of those who, following the example of Winckelmann, strove to penctrate to the true spinit of antique art, in opposition to the false taste of the time. The study of vase-paintings, and of the Pompeian mural pictures, then just revived, led him to abandou the sickly mannerism of his predecessors for the severe simplicity of the antique, and he may with justice be styled the auther of motlern riliero (see Altolilifero). His werks are not, however, all of equal value, and, in general, it may be said that his skill in modelling was not equal to his imventive genius. The poctry of his conceptions is of a high order. F. contributen much towards bringing the outline style, now so popular, into general usc. Of his seulptures, the best known in England are his bas. relief monument to the poet Collins at Chiehester, the monument to Jord Mansfield, and that to the Paring family at Micheldean Church, in Hampshire. His model for the shield of Achilles, taken from

Tine luth bank of the laicel, is partimalarly wothy

Flas'bsNE (Putiontio), a erenus of plants of
 havint hemisperical imbricated involucres and rallow thavers; the whole phat cmitting a peondar Gromatic sumell, sumetimes compareal to that of soan, which is satel to he edticacious in driving away lleas.

Fluabne (Pulicaria dysenterica):
a, root: $b$, iop of stem, with leaves abil flowers; $c$, achene, with parpur ; $u$ pistil; $e$, a floret of the disc ; $f$, astamen; $g$, a fluret of the ray.

Two species are foum in Englants one of which ( $P$. dysentinica), common in moist places, with Whons leaves, stem 10-15 inches high, cottony, and bearing panicled flowers, has a consideralile reputation in diarrluea and dysentery. The Russian sidilers, in the expedition to Persia under Genoral Keith, were much troubled with lysentery, which was cureal by this phat.-Comymi squarrose, also called thealane belongs to a nearly allied genims.

FLECHIE, La, a town of France, in the depart. ment of Narthe, is agreally situated on the right hank of the Loir, of miles south-sumth-west of le Mans. It is a well- huilt town, and has three principal streets, which are wide and well paved. Its mincipal building is the military school, with a library of 15,000 mhumes, lestinat far the equeation of the sons of por otticters, or of sulliers who have highly distinguisholl themstlves. The building now necupurd by the schond was woe a royal palace, and was built ly leney 1Y. It was sulsequently given lig him to the Jesnits, and usel by them as as Jwat colloge Dhwe I'tince Eugene, Descartes, and liarel the astrommor, were chacated. F has some trod in com. hay, and wine, also manfactures of linem, hasiery, and glases. Pop. 70.7.

FLん'CKNOE, Vimmari, the late of whose hirth is muknown, is said to have been an Irish homan

## FLEET-FLEET PRISON.

Catholic priest. He came to London, mingled in the wars of the wits, and wrote several pliys, all of which are now forgotten. He died in 1Gis. F. came nultor the lash of Iryden, whose satire, entitled Ifuc Flonoe, is partly the monel of Pope's Duncial (II. r.), and will be remembered as long as the great satirist is remembered. From those who are acpuainted with our extinet literature, we have the assurance that $F$. has been hardly dealt with; that though he diil not rise to the ramk of Dryden as a foet, lie was the author of several fugitive finces, mot withont srace, fancy, and haypy turns of expression. Among his dramatic lineces are E'rmint, or the Chaste Lady; Lore's Dominion printed in 16.54, and dedicated to Cromwell's faworite daughter, Mrs (layple); and The Murcrige of Joconus and Brthmia. His Miscellanea, or Poems u" all sorts, aptwared in 1603 .

FLEE'T' (that which fluats), a collection of ships, whether of war or commerce, fur one cibject or for one destination. The diminutives of fleet are 'livision, and 'squadron.' In the royal mavy, a tleet is ordibarily the command of an ilmiral or vice-admiral.

FLEET MARliAGES. The pactice of contracting elandestine marriares was very prevalent in England before the passing of the tirst marriage act (see Mamriate). The chapels at the Savoy and at May Fair, in London, were long famons for the preformance of these marriages; hut no other place was equal in motriety for this infamons tratfie to tho Fleet Prison. It must be observed, that before the passing of the 26 Geo. II. c. 3:3, there was no necessity in England for any religious ceremonial in the performance of marrige, which might be contracted by mere rerbal consent. Hence it was not in sirtue of any special privilege existing within the liberty of the Flcet that marriages at that place became so common; lut rather from the faet, that the persons by whom they were ferfurmet, having nothing to lose either in money or character, were able to set at defiance the penalties enacted from time to time with a view to restrain this public muisunce. The period dwing which these marriages were in greatest repute was from 1034 to 175t. The first notice of a Flect marriage is in 16 I, in a letter from Allerman Lone to Lady Hockes, and the first entry in a register is in 167\%. "Yp to this time, it does not alpear that the mariages contracted at the Fleet were clandestine: lont in the latter Far, an order hawing been issued ly the ecelesiastioal commissioners against the $\mathrm{p}^{n+\text { formance }}$ if clandestine marriares in the Savoy and Day Fair, the Fleet at onee beame the favourite resurt for those wha desired to effect a seeret marriace. At first, the eeremony was performed in the charel in the Flect: lont the applications lecame so freguent, that a remular trate sperdily sprung Mp By 10 Ame, c. 19, s. 176, marriges in chaple without lanns wore prohibited unter certain penalties, and from this time, rooms were fitted up in the taverns and the louses of the Fleet parsons, for the purpse of perfonming the ceremony. The persons who celehrated these marriages were clergmen of the ('hurch of England, who had been consigued for deht to the prisn of the Fleet. These men, having lost all suse of thair holy calling emploged tonters to bring to them such persons as required their atice. The sums paid for a marriage varied aceorting to the rank of the parties, from half-a-crown to a large fee where the liberality and the purse combneil to afford a large reward. During the time that this iniquitous trattic was at its height, every species of erommity was praetised. Young ladies were comprelled to marry against their will; young men were decoyed
into a union with the most iufamons characters: and persons in shonals resortem to the parsons to the united in bonds which they had no intention should bind them, and which were speedily broken to be contracted with sume new favourite. The sailors from the neighboming locks were steady patrons of this mokle: it was stated ly the keeler of one of the tavems, that often, when the tieet was in, two or three hunked marriages were contracted in a week. Persuns of a more respectable character also at times resortel to the Fleet. Thus the IIna. Henry Fox was here married to (Qeorma Carnline, danghter of the second Duke of Itichmond. Penmant thus describes the neighbourhood of the Fleet in his time: ' In walking along the street in my youth, on the side noxt the 1 rison, 1 lave often been temped ly the question: "Sir, will you be pleased to walk in and he married?" Along this most lawless space was loung ul, the frequent sign of a male and female hand conjoined, with "marriages pramormel within "written beneath. A lirty fellow invited you in. The parson was seen walking before his shop, a stualid, dirty figure, clad in a tattered plail might-rown, with a fiery face, and ready to comple you for a itram of gin or a jipe of tobacco.'
London. 1) 193. Regsters of these marriuges were kept by the varions parties who officiated it collection of these broks, purchased by government in 182I, and depositel in the Cunsistory Court of London, amonntel to the incredible mumber of letween two and three hundred large registers, and upwards of one thousand smaller books, ealled jocket-hooks. These registers were not received as evidence in a court of law (Doe al Duries $v$. Gatacre, 8 Carr. and 1'. 578), not because the marriage was invalid, but liecause the parties engaged in the ceremony were su worthless that they were deemell undeserving of credit. Various attempts were mate to stop this practice by acts of parliament. By 6 and 7 Will. III. e. 52 , and agam by 7 and $s$ Will. 111. c. 35 , penalties were imposed on clergymen celeinating any mariace without bams; but these provisions were without dffect upon men who had mothing to lose. At length, the misance lecame intolerable, for, owing to the liffeulty of poving these marriases, reopectable parties, who in folly had entered into them. fomul it ofter impossible to estallish their marriare, anil the greatest ennfusion was in consequence producet. The act of the 2oth Geo. II. c. 33, was therefore passed, whieh struch at the root of the matter by declaring that all marriages, except in Scotland, soleminsed otherwise than in a chureh or public ehapel, where lanus have loen published, unless by special licence, should be utterly voil. This act met with stremons "lposition in the Honse of Commens, esprecially ly Ar Fox, whe had been himself married in the liket, but ultimately it was prassed into a law. The public, however, were unwilling to surrender their privicse, and on the 2 bith Nareh 1754, the day before the act came into operation, there were no less than \%17 marriages entered in one register alone. Sce Jimm's Mistorg of Flit AMarria!es, to which we are indebted for many, of the above particulars.

FLEET Plisison, a eclebrated Lendon jail, which stond on the east side of Faringidon Street, on what was furmerly ealled Fleet Market. The keeper of it was ealled the Warden of the Fleet. It derived its name from the Fleet rivulet, so mamed from its rajuly, which fluwed into the Thames. By the Act 5 and 6 Victoria, the Fleet I'rison and the Marshalsea were abulished, and their functions transferred to the Queen's Bench, under the new name of the Qucen's l'rison. The Fleet was the king's prison so far bach as the loth c., and a reeeptacle for deltors since about the same period. The

ELEETWOOH, M FLEETWOOD-ON-WYRE, a small hat thriving towne, sealnat, ami military "tathon of Enolunl, in the conmery of lancanhere, is situated un in minuntory at the mouth of the thary of the Wrris about $?^{0}$ miles sonth-west from Lancaster. It is a molern town, and owes its orinin aml inquctance to its facilities for railway am steam-vesel cmmmacation. It is hamsmmely luid out, has an excellent harlootr, and is a favourite rusert for seathathing. A govemment sehool of musketry, which promises to the for the north of Enchan what Jythe aml Allershott are for the sonth, is now in full operation here. It has a staff of instractors, ami quarters fir 300 men and bo wflicers; leseides a sulnstantial hut-meamphment, about a mile from the town, for 200 men and 14 ufficers, where there are quaters for marrial suldiers, hospital, lecture-rooms, \&e.. and a large trant of had for rifte gractice. Ahwint 2000 vessels cuter and clear the purt. Pop. (1061) 8531 ; (1571) 42 C

FLEMISII LANGUAGE AND LITERA. TURE. The Vamisch or Fleminh is a form of Lew German still spoken in the helgian provincess of East an! West Flanders, Limburs, Antwerp, Sorth Bralnant, and in some parts of Hollame and the Wallom provinces of Betpium. So little chante has taken phace in this dialuet, that the form if specch in which the ('oumeil of hiptines drew up (in Ft?) the crech, in which pagans were male to express their renmatiation of idelatry on l, cing converted to Claristianity, requirs mily the alteration of a few ietters to make it intellyible to a mulern Fleming. Flomish hats much attinity with the Frisian, and crnstitutes, thenther with morlern Luteh (which was originally ikentioal with it, and now only differs from it in a few orthoraphical and itherwise nurssential particulars), the national tonge of the Whole of the Lew 'ountries. The most ancient reword of Flemish, is a fragment of a translation in frose of the I'silms a thonsam years ohl. In the Fith e., puldic rewts began to be drawn up in the errnacular, which are frofectly intellicilile in the preseut day (as the Ordinance of Henry I. of Brabant, 12as, in the Rransels bunk of Privilequs). In the same watury, I. wan diaerlant, the "father oi F'lemish pucte, "anthor of The Mistorimh Mioror,
 hase comyssed nummans peroms, anl translated from the Fronch and Gorman, wal very probatbly from the Lath. Wildems and whor critics beliest that th the" l"hemish must be aseribel the honenr -I the ariginal :mil "ntire $l^{n k e m}$ of Prinert los, the first fart of which they rofer to the mumele of
 tw IV: sin Vtenhove, and suppused to have luan writem allont 12.a. The 1 thla e. was rematkable for the numbers and exedtence of the flemish
 punts, some of whase works have ben pmblishod hy bammater: and for the orinin of the "hambers uf Jhothric. which exerted a marked inthume on thar yruress of literature during sucererling ages, ami beame the arbiters of literary and ilramatic fome throngh the Netherlands generally. In the lith c., the fremeh clement gained ascendeney, and the ofl Flemish lost muld of its original terseness and furity. Nouncrons transhations of the somptures aprearel: among the most remankable of which are the l'salns by Dathenus (1506), amd ley Mamix (15s(1), the anther of the Poomsore
 lible was not effected till lG1s, when the General symod of Dort deciled to emplay learned mea capable of giving a correct version fron the Hebrew and Cirele texts; and this great work was finaliy (1)mpleted hy two Flemings, bitubact and Walons, amb two linthanen, Bugemann and Hommins. Stremons efforts were also made, at this period, to give greater freedom to the Flemish hangare ; ani hence this original Flemish versiou of the bible has become a standard in regard to the construction and orthograply of the langage. Hooft, Vondel, and Cats are the three men whose names stand foremost among the Flemish writers of the 17th century. Ifooft was a poet, bat he is best known loy his Mistory of the Ditholands, which is heht in hish esteem by his countrymen. Tomiel, who was one of the lading men of his day, made his travenies the relmeles of harling the most cattino satire on every olmoxims measure of the gowemment: and his works still mantain their mound. He had great versatility of jowers ; and in his latter years, his talents were directed to the exaltation of I atholicism, to which he hanl heen comverted. Ciats was cesentially the pret of the people; and for 200 Years, his works, p"pularly known as the Huuscheth Bidle, have been cheristbel alke among the poor and wealthy. Although eats was a skilful lawyer, in active statesman, and a profomd scholar, be found time to compose a ereat number of works, as the Zortplet; Tromarinf (the Wedding ling); Houuthych (Marriage), which exhibit the most intimate acquantance with the everyelay-life of his comntrymen. His Morel Énllems have recently (1S59) been translated into English, and published by Mesers Longman \& Co. 'The 1Sth c. was barren of prectic genius in the Low Comentries, but it Iroducen several frod philolmgists, as Stevens, Hugilecopor, and Tru Kate, the latter of whom is the zuthor of a work on the Flemish language, which has served as a fimedamental inuthority for monderu writers. The arhitrary measures of the French goverument, muler Napmeon, against the oflicial use of Flemish, had the effect of crushing for a time the very slirit of matimalism, while it completoly amihilatel native literature; and it was not till after the revolution of 1530 , that 1 he Flemish language rusinel its footing in the belyian provinces. This nevival of the national form of speech is manly due to the unremitting efliorts of such writers as Willems, Billealijk, Curnelissen, Blommaert, Conscience, Delecourt, Ledeganck, \&e, whose works have inpartel fresh vigour, and greater grammatical precision to the flamish. In 1541, on the occasion of a linguistic congress held at cihent, the members of the government for the first time pullicly recognisel the existence of the Plemish clement in the perple and adherssert the meeting in the national dialect. The last twenty years bave eonfirmed this
movement ; an? while th. best forcin works have been rendered inte Flouish, the writines of Blommaert, Conscience ( $\}, v$. ), and other native authors have been triaslated into many of the European tongues. Sce sleecx on the / Iiviory of the Flomash, and its Relation to other Languet/es; Willems (1819 -IS:-t), Verhanell. oe. d. Nederduy.; O. Dclepierre, Ilistory of Flemish Literchure ( $\mathbf{S 6 0} 0$ ).

FLEMMING, PAtri, one of the best German poets of the I7th c., wits born October 15,1609 , at Hartenstein, in the princiality of sehinhurg, where his father was minister. He stmdied melicine at Leipsic, but was induced by the distractions of the 'Thirty Ienrs' War to retire to IIolstein in $\mathbf{1 6 3 3}$. In the same year he accompanied the cmbassy sent by the Duke of Holstein to Russia, and in 1635, was attached to the more spleudid embassy sent out to Persia. He returnel in I639, married, and resolved to settle as a physician in Hamburg, lint died there al April 1640 . F stands at the liead of the German lyric poets of the 17 th $c$. His Geistliche und welliche Pormuta (INena, 1642) contain many exquisite love soncs, which, for more than is century, remained unequalled in finish and sweetness. Others are distingushed for enthusiasm of feeling, ardent patriotism, and manly vigour, while his sonnets are marked by strenglh and thorough originality. ['.'s louger prems describe the adventures of his journey; occasionally at least with sreat spirit. thongh they are not free from the weaknesses of his time. His lreautiful hyoun, In allen meinen Thaten, comprosed before his journey to Persia, proves his genius as a writer of sacred songs. IIis life, with his sclect poens, was pullished by schwab (Stuttgaml. ISOO). Compare Knapu, E'eangelischer Liederschats (Stuttg. I830), and Miillur in the Bibliothek Demfocher Dichter des 17 Jahrhembert ( 3 vols., Leipsic, ISO2); and Varnhagen von Ense, in the 4 th vol. of the Biographische I) mbinale.

FLENSBORG, the most populous and considerable town in the anchy of Sleswir, at the extremity of the Flenshore Fjord, an imlet of the Baltic, and 19 miles morth of the town of Slesvig. Pop. 15,572. It is the capital of a balliwick of the same name, which included the north prat of the district supposed to have been the conntry of the Angels, or Angli. F. is suid to have bem fomaded in the $12 t h \mathrm{c}$, and named from its foumder, the knight Flenes. In IoSt it receiverl mmicipal rights from king Valdemar. $F$. is phemantly situated, anel has a drood hariour. It has suger refineries and distilleries, and manufactures of eloth, barer, soap, and tiles of superior fuality. The trale is comsiblevalle. $F$. owns betneen 200 and 300 ships, many of which are built in its own yarls. A railway, 43 miles long, connects F. with Tonningun on the Eyder.

FLERS, a town of Franer, in the department of Orme, north of France, 35 males west-north-west of Alencon. It has in old castle, whieh was burned down in the Chonan war, but which bas been recently restored. $F$. has considerable mannffetures of linen, fustian, and especially of ticking. Prup. 5843.

FLish is the ordinary term for musenlar tissue. After the removal of the Lhod-vessels, nerves, con. nective (or cellular) tissue, do., the Hesh is fonnd to consist of various textural elements, which are described in the article Muscle ( $1 . v$. ). Numerons analyses have been made of the musenlar substance of varions animals. In Dr Day's translation of Simon's Amimal Chemistry, published ly the Sydeulan Society, there are analyses of the flesh of man, the ox, calf, pig, roe, pigeon, fowl, carp, and tront. The following table gives the determinations of the individual constituents of the flesh of oxen, or in ordinary languge, of beef freed, as far as possible,
from blomevessels, de., and may lin rewarlerd ass fainly reprosenting the compusition uf thesh geverally.

FLE: $\mathrm{T}^{2}$, the title of a waluald treatise on the Jaw af lendand. It is mot known by whon this treatise, which it we of the barlust anthorities on lombla law, was written, and it derives its title from the ciremonstance that it was written in the Floct prison. Lorl ('immbell remarks-l.ires of the Chum, lloss, i, lifit aml note: 'I shall rejoice if ! (l) tardy justice to the memory of Robert Burnel, deciderly the tirst in this class, and if 1 attract nutice to his suceessors, whe walked in his fontsteps. To them, tom, we are mobably indebted for the treathess entitled Fleh and britton, which are said to haw hern written at the recuest of the king, and which, thoush inferior in style and arragement to braction, are wonderful performances for such an age Fhie monst have he written after the lath year of the kine (Elward 1.) and not much later; for it frefuently quetes the statute of Westminster the secench, withont referring to the later statutes of the reign,
FLETCHER, ANDREW, of Salton, a celehrated Scottish pratrint and politician, was the son of Sir Robert fletcher and Catherive bruce, daughter of Sir Henry liruce of Clackmanan. He was ham in
 fethos wheh eharacterised him throngh life, $\because$. was of lanhish descent by the father's side; lis father boing the fifth in the direct line from sir Dernad fideher of the comaty of lork. But his mother was of the royal Hunse of scotlant, the first of the Clackmanan family having heen the thind son of the Lord of Ammade, Rowert de Itrace, whon wos the erandfather of the great king lintert. FI's father, who diad in his chimblumen, comsinned him to the care of Gillort burnet, then minister of saltom, afterwards the well-hown bishop of Salinhay; ly whom he was instructed not anly in litarature and religion, but in thase principles of frem ghemment of which he afterwads freathe su zodnas an advosate. So carly as 1681 , when he sht in pardiament fort the lirst tme as consmissioner for List hothian, F. offored su determined :an opponition to the measures of the Duke of $\begin{aligned} & \text { 'onk }\end{aligned}$ (afterwarls domes 11), then actine as the hoyat Commission en in contland, that he fonme it necesssary to retine first intw England, and then into Holland. He there anterel into close alliance with the English refugers, who han assemblad in considerable numbers: man on his return to Euglami in 1683, he shared the comusels of the party of which Jinsell, Essex, Jloward, Alfernous Syans, amb John Hampden (the rawism of the still wore famons patriot of the same name) were the Jentwo. Thomgl usually regardil as a repmblican, F's pult.
 far nearer to aristocracy than in demoneray $\mathrm{y}^{\mathrm{m}}$ the motern sense; for thazin he was diaposcil to restrict the monarchical element of the constitution
within the narrowest limits, if ant to aloulish it alturether, he was so far from being an advorate for a maveral larticipation in political ryhts, that one of his fivontite sechomes for the reformation of thas lusts of sagrants and puprers hy whom Scotland was infested in his day, consisted in the estab, halment of slavery in the form in which it had "vintol in the classical nations of antignity. On the diseovery of the lhe llonsa plot, Freturned tw Il. 1 hand. Dis mext visit $t_{0}$, Dingand was as a vimutare under the unfortmate lhke of Nommonth in 1605; hat he was compelle to leave the iasurecot amy, at the logimamy of the centerprise. in consednence of his hawing shat the mayor of Lyma, whth whom he hand hal a personal yuarrel ahont a lorse. The next hiding inace wheh F . shected was Spain; lint he hat no sooner arrived, than he was thrown inte prison at the instance of the Enclish ambassador, and would have been transmitted to England, to share the fate of his fillow patmots, had he not heen mysterionsly delivered from prison ly an manown friend. From Sbin le proceded to llungary, where he entered the army is a volnmeter, and greatly distinguished himself. De returned to Englad at the Revolution A few years later, he met in lomdon, aceidentaly, it shonld seem, the fatuos William laterson, the fommer of the Bomk of Eughand, and the projector of the Darien Expedition in London; and it was at $F \because$ sullicitation that Paterson came to Scotland, and oflered, to the acceptanee of his countrymen, aprojeet which he hat originally intended should he carried out loy the far ereater resourees either of the trading commanities of the llanse towns, or of the princes of the Corman empire. The litterness cansed hy the treatment which the barion colonists receivel at the lands of king Willian's guternment, tendel to contirn F. and his frienis in ther onposition to the Cuinn with England, and hed to has delivering in parliament those spirited harangues in farmor of an exclusive Scottish mationality, which still stir the hood of his conntrymen. Ifter the Linion, he retired in dixunst from paldic life, and died in Lonton in 1716. F's wrotines originally appeared in the form of tracts, am anoumonsly ; they were, however, collected and relrinted at London in 1737, unter the title of The Political Horks of A ndrew Fldther, Ew, mire.

Fletchimr, files and Pimseas, were the sons of Mr tibles 1 leteher, Queen Elizalneth's ambassadur to the cont of Russia, and cousins to Fletcher the elramatist.
(illes, the cller, was born about 1580; he was educated at Combridse, amd dicd at his living at Altertom in 162:. Jis clicf poctical work is a
 Which alleared at Cambinge in fito. This pem, althmuth mace admirel, is now unkmon to general readers, amb is chichy remarkalle for hation, to some extent, moulded the majestic mune of Nilton.

Jminans the yomger buther of ciles, was born about 1.88, edncateí at Etun amd 'ambridue, and Trcane rector of lilasy, in Norfolk, in 16:1, amd died there in 1690 . Wis most important prom, the I'arple Solemt, we the Iste of Mun, was pmblished in $160 \%$ It contains an elabomate description of the hanan lonly and mind - the former being siven with preat anatomical mantencss. The mind is reprefonted as beinn beleasumed with the vices, and likely tobe sublued, when an angel comes to the rescic-the andel being Jaues I. Although to a lan" extent fornal and pedantic, the P'urple Ishend ahnimuls in time passinces, in which the lusciousness of Apenser and the gravity of Niltun are curionsly mingleel.

## FLETCHER-FLEXURE.

fletcher, Joun. Sce Deacmont and lletcher.

FLEUR-DE-LIS. Anthmities are divired as to whether this celebrated cmblem is derived from the white lily of the garden, or from the llatg or iris, which, as generally represented, it more resembles both in fom and colsur. 'Ancient heralds,' says Newton (Diwplay, 1'. 145), 'tell us that the Franks of old had a custom, at the proclamation of their king, to clevate him upon a shield or target, and place Fleur-de-Lis. in his hand a reed or flag in hlossom, instead of a sceptre; and from thence the kings of the first and secoml race in France are represented with seeptres in thein hands like the Hate with its flower, and which fowers became the armorial tigures of Frimee.' However this may be, or whatever may lo the value of the other legendary tales, such as that a hore baner, cmbroitered with grden fleurs-te-lis, came down from heaven; that an angel gave it to Kins Clovis at his haptisn, and the like; there can be little doult that, from 'losis downwards, the kings of France lore as thoir arma first an indefinite mumber, and laterly three solden lifies on a Whe field, or, as heralds would say, azure, three fleurs-de-lis, Or-It was 'hates VI, who reduced what had hitherto been the indelinite number of fleurs-de-lis to three, dispusat two and one; 'some comjecture unon acomint of the Trinity, athers say, to represent the three diflerent races of the kings of France. - Nisbot, i, :Sh: Many Enclish and Scotch families bear the if ur-delis in some portion of their shich, and genatly with some reference to France.
FLEURUS, a small town of Pelsimm, in the province of Hainault, is situated morth of the left bank of the Sambre, and 15 miles West of Namur: pop. about 2200 . It has been the sene of several contests, the last and most important, however, being the battle of F., fought liere 2Gith Jume 1794, between the army of the French lepmblic, consistimg of 89,000 troops, under Jourdan, and the allice, who were inferior in mumerical stronsth, noder the Prince of Saxe-Coburs. The latter leader gave orders for a retreat at the very monent when a resolnte advance might have decided the victory in his favour, and the result was, that Jourdan was emabled to unite his army with those of the Noselle, the Ardennes, and the North, and that the allied forces were compederl for a time to evacuate Flanders.

FLAURT, FLORY, FLOWRY, FLEURETTE, de., in heraldry, signifies that the ohjoct is adornod with Heurs derlis; a cross Henery, for example, is a cross, the cumls of which are in the form of fleurs. de-lis. There are several varieties in the mondes of representing these crosses, which has led to distinctions leing made letwern them hy herades tuo trivial to be mentioned: hut they are all distinguishable from the crossjontanee, or rotancée, incorrectly spelled batonce liy English heradds. ( Mackenzie's Stience of Morationt 11, 4). In the latter, the limbs are in the form of the segments of a circle, and the foliation is a nere bul: whereas the eross flemry las the limbs straight and the teminations distinctly floriated. Thus-

Cross-patance.

Cross-fleury.

Ierlaps, the most celebrated instance of this bearing, is in the case of the donble prepuce flowery and connter-flowery gules which surrounds the red lion in the royal arms of Scotland, and wheh Charlemagne is said to have conferred on Achaims, king of scotland, for assistance in his wars. The object, according to Nisbet (ii. 101), was to shew that, as the lion had defemded the hlies of lyance, these thereafter shall continue a defence for the Scots lion, and as a badge of fricudship, which has still continued.' 'That the lilies were assumed in consequence of the intimate relation which prevaled letween France and Scutland for so many generations, will not be doubted; but the special accasion of the assumption may not be almitted in our day te be quite beyond the reach uf seepticism, notwithstanding Nisbet's assertion that it is su fully instructed loy ancient and mondorn writers that he necd not trouble his readers with a fong cataloghe of them.

FLEURX, Claude, a French church histritian, was lown at laris, Gth December 1640, and was cucuated at first for the law, lout preferring an "celesiastical career, subsequently towk priest's orders. In 10:2, he became tutor to the yonng l'rince de G('miti, wher was brought ap alones with the dauman, and at it later perind, to the Comte de Vermanduis, natual som of Louis XIV. After the death of the ('mate in 1653, the lrenel monarch appointed him, under Fencon, tutor to the lrinces of liramily, Anjon and Berri, and also abloot of the ('intercian momastery of Loc-lbieu. When the pinces had completed their education, F. was rewarded with the promate of Argenteuil. The Duke of Orleans selected him for confessor to the youmy kines. Lonuis XV., giving as his reason for so doing, that f . was meither Jansenist, nur Molinist, nor Ultramontanist, but Catholic. F. ludd this oflice till 1720 , when the infirmities of age compelled him to resign it. He died 14th July 1723. F. was as leamed as he was modest, and as mild and kind-heartend as he was simple in his maners, and uright in his conthet. Amring his mumereus works may be mentioncel, Muars des Isicuilites (Piaris, losi); Maturs dis Chétiens (Paris, 166O) ; Tratée du Chois et de lie 1h thoilc des Litudes (Paris, 1656): Institution au Droit Berlesictstigue (1657); aml, above all, the IMistuire Eechesints ique ( 20 vols., I'aris, 1601-1720). On this work, F , laboured thirty years. It is marled by arat learning, and, on the whid by a julicionsly critieal spirit. That may be called lis purfessional symputhus, are held in check liy a molle desire to lie impartial, which might well put to the hhsh the unveracious partisanship of many Irotestant writers. Somler ( $l$. v.), an tminent German theolouical professor, avowed that his lectures were at first mainly extracts from the /Iistoire Declesionsfinue. Even Valtair" praised it. 'The history of F.,', says he. 'is the hest that has ever heen exechtel.' I'Alembert, and many others, recommend F.'s style as a model of alegant simplicity. The so-
 dublished at Parne in 1726, is ascribed to Frederic th. Great. A posthumous work of $F$ 's, catitled Miserouts sur liss libertés de l'Eglise Gullicane, has aways leen very popmar.
FLEXITRE, or FLEXION, is the lending or curving of a line or figure (sec etriature). A curve is sail to have a point of contrury flexure at the point where it changes its character of concavity or convexity towaris a given line. In the art of buiding, thexure denotes the londing of loaded heams. If a beam, supported at its two ends, be loadod, it lrends, its lower surface becoming convex, and its upper concave. In this bending, the particles

 masigator, to whom we are indeloted for a enrect kumbledge of a wreat purtion of the Australian anats, wis horn at bonimuton, in Lincolnshire, 1/tio. He conteral the merchant sorviee at an early are, and shmednentiv the rusal nary. In 170.5 the sessel in which he was midshipman conveyed the fovernop of Now Hollind t" latany bay; and whie there, F. Andmine to investigate the const sonth if l'ort Jackens, ahout Zool leagues of which weredid huwn in the charts as 'unknown.' With an eqully daring and ambitious poung surgeon in his ship, called bass, he departed on the cuterprise in a small decked ressel, with a crew of only six men. Their chun discorery was the straits between Van Dumen's Loml (now 'Tasmania) and the mainland if Austrolia, which were named after Bass. In 180, F. nltamed from the British government the enmman of a scientitic expedition for the inventigation of the Anstralian consts amil their promets. Commencine his examination at Coper senwin, $P$, in the course of two vears, gramally expherel the coast to Dass's straits, thence morth-wath-hying down carefully the Great Barrien Fievesto the Gulf of Carpontaria, which he thomaly survered acms to 'limur, then back to Gape Lenwin, and romut the south coast t" lont Facksom. In 1810 he was liberated from a six years imprismment ly the lrench in the lsle of France, returnal to England, and gave the woml the result of his researeles in a work, entitled a logmeg to Terme Alratrellet. Dle died in July 1814, the day on whilh his lowe was published.

FLINHERS LANI), now South Anstralia (f.v.).
FTSNDE'RSLA, a whas of trees of the natama orler colmhert, ome species of which, $F$. atustralis, yichs timber liteln inforion to mangeny. It is much used in Australia, and is there ealled Cubicmea Woon.

FldNT, a minemal wheld may le regarded as a sarity of guat\%, we in intmoniate lutween finart\% and of nif, comsinting almost contirely of silica, with a very litthe lime, osile of irm, water, carhon, and sometimus won traces of ursumic matter. It has a that shell liko fracture, is tran-lueent or semi-transparent, and varies in culnar from a very
 vellow, and grayish white, and is sumetimes wined, clouded, marbleid, or spotted. I ark-colomarel dimis are most common in the chalk, in whith prineipally F . oecurs imbedden, forming motutes of farions sizes, sometimes lamge mulular masses, oi irremuar and often grotesque sharu; lat gravil formed of light-coloured tlints is tery commom, and it is disputed whether or not a change of colour has taken pace by exposure to atmospheric and other chemical agencies. $r$ is sometinus fonnd in 1 evis or veins. It is very abumbant wherewer the claik formation extende, in lighand and otler conntries;
when $t$. modules are also often found in comphoul woks, amd in allurial soils; vast alluvial tracts beht sometimes full of them. F: peorle's often contain rystals of guartz. $F$. nombles are ushally monst in the interior if broken when menly t.k. n fom their luds.
F. is sometimes lareler than guart\%, sufficiently so t. seratell it. The realiuess with which it strikes fire with steel is well known, thm it wonld seem that the sparks are not all merely incandescent particles, heatel by the friction, hat that in some of them a chemical combination of silica ame iron takes place causing great increase of heat. The use of the $F$. and steel for ignitind tinder, once so common, has been almost superseled ly that of lneifermatches, and gun-flints have given place to perenssion-caps. Aceordins to Pliny, Clias was the first who strack fire with flint; or more prohally, he was the finst to shew its application to useful imponses; and he therefore received the name I'frodes. The most ancient use of 1 '. was probably for sharp weapons and cutting iustroments: and $\vec{F}$. kuives, axes, arrow-hemils, \&c., are among the most mteresting relies of rude antiquity.
it present, a prineipal use of F . is in the mamfacture of fine earthenware, into the composition of which it enters, leeing for this purpose iirst ealcined, then thrown into eold water, and afterwaris powdered.
The origin of $F$. is a sulaject of consideralle difliculty. Nilicions delosits are sometimes a purely chemical operation, as in the case of the silicions sinter fomed round the sevsers of Iceland, from the evaporation of water largely charged with silex. but at the botom of the sea, as no evanmation conh take place, some other agent than springs of water saturaterl with silex must have suppifed the materials. It is a fact of considerable impurtance in this inguiry, that almost all large masses of limestone have thin silicions eoncretions, or tlints. Thus, chert is found in carhoniferous aul wher limestones, and menilite in the tertiary limestones of the J'aris hasin. The conditions necessary for the deposition of calearoons strata scem to be those refured for the fumation of silicions concretions. The materials of both exist in solution in sea-water, amb as it needed the foraminifur, the coral, and the molluse to fix the carbonate of lime which formed the chalk deposits, so the silex was secreted by innomerable diatoms and slonges, am their remains most probahly supplied the material of the flint. The discovery by Dr Bowerbank and other microsempists of the spicules of sponges and the frustules of diatoms in almost every specimen of l ., has clearly shewn that $F$. to a large extent, if not entirdy, owes its origin to these minate organisms. It is, however, difficint to acconnt for the changes that have taken place in these materials subsequent to their deposition.
FLINT, a parliamentary borongh and seaport in the east of Flintshire, North Wales, formerly the eapital of the county, on the left side of the estuary of the Dee, 191 miles north-west of London by rail, and $[? 4$ miles north-west of (hester. It forms a rectungle like a lioman camp, ant is surrounded by now nuarly obliterated ramparts and intrenchmonts. The Dee estuary is some miles wide here, lont is shallow and narrow at low water. Vessels uf 300 toms reach the town. The mincipal exports are coal and lean from mines in the vicinity, which allime the chacf employment. Pop. (186i) :3.340. It unites with seven other places in sending whe momber toparlianont. Roman relics and traces of Thman lead smelting-works have been found hore On a low fruestume rock in a tidal marsh are the remans of at eastle, built by llemry Il., amd
dismantled in 164. The doulle tower or keep is 40 feet in diameter, and inchudes two concentric walls, each 6 feet thick, with an intervening gallery 8 feet broad; within, is a circle 20 feet in dianacter, with four entrances. Deterioration of the ehamel of the Dee has made F . in a great degree a prort of Chester, and here lareer vessels, especially with timber, are discharged, aml the carges thaterl up the Dee in smaller vessels, the timber io rafts. ( $15 \% 1$-pop. 427\%.)

FLINT, a river of Georgia, ne of the United Stites of America, unites on its firht with the Chattahoochec, at the sontl-west anghe of the state, to form the $A_{p}$ palachicola, which, after a conrse of 100 mules, caters the Gulf of Mexico. The F. itself is about 800 miles long, heing practicahle for steam-boats up to Albany, abont $\because 50$ miles distant from the sea.
FLINT, Thothy, Pev:, an American eleroman and author, was bom, in 1780, at lieading, Massachusetts, and graduated at Harvard College. In 1802 he lecane minister of the Congregational Clurch in Lunenburs, county of Worester in that state, where he remaned till 1814. In the following year, le became a missionary for the valley of the Missis. sipfi, where he was engaged in itinerant preaching and teaching a school. In lsor, he returned to the nortlern states; and in 1sen, puhliahed his frmollections of Ten Yeurs jussed in the l"alley of the Mississippi (Boston, Svo). The same year apmeared from his pen a novel, entitled Francis Berritn, om the Mesican Patriot, ]urportines to lee the autohios. Fraphy of a Sew Eucland adventurer who acted a comslienoms part in the first Nexican revolution, and in the overthrow of Iturhide. In lses, he issued two works: A Comblowel Gemprapley and Mistory of the JFatom states in the Missiossippi Trolley ( ('incinanti, 2 wols. Svor); and Athur Clonnint, a movel (lhilatelphia, 2 vols. svo). Abother novel, Gorg, Mason, wr The Backuondemen, and a romance in " $\because$ vols., The Shoshomee $]^{\prime}$ allen, appeared at Cincimati in 1830. In 1533, he edited several mumbers of the Kinekertocker Vorgain, am? was subsequently editor for three years of The Western Monthly Mogratine. His other works are: Indime Wiars in the IWest (1833, 121no) ; Lectures on Suturel Mistory, Ceolog!, Chemistry, and the sitw (Buston, 1833, 1 Imo ; translation of Droys Lidrt datre Heareuse, with additions by translator; aud fiongraphical Memoir of Deniel Boone, the Host Sretter of Kentucky (t'incimati, 1504, 18mo). In 1s:3, he contributed to the Lombon Ithencom a series of sketehes of the Literature of the Uuited Sitaters. IIe dierl at Salem, Amonst 16,1840 .-II is son, Mican I'. Flint, pmblished a volume of poetry, entitled The Hunter ured other Poems.

## FLINT GLASS. Seefiliss.

FLINT IMPLEMENTS AND WEAPONS, believed to have been used by the primitive inhabitants, have from time to time, in more or less number, heen turned ap by the plougls and the spade, dug out frou aneient graves, fortifications, and dwellingplaces, or fishen up from the berls of lakes and rivers, in almust every comntry of Eurone. They do not differ, in any material respect, from the thint iunlements and weapons still in use among nocivil. ised tribes in Asia, Africa, America, and the islands of the Picific Ocean. The weapms of most frequent ocemrence are arrow-heals (see Elf-Ahinows), spear-points, datger-blades, and axe-heals or Celts (1. w.). The more common implements are linives, chisels, rasis, wedges, and thin curved or semirircular plates, to which the name of 'scrapers' has lieen given. There is great varicty, as well in the size as in the shape, even of atides of the same kind. There is equal variety in the amount of skill
or lalour expended in their manufacture. In sume instances, the flint has luech roughly fashioned into something like the required form by two or three blows; in others, it lias been laborinusly chipped into the wished-for stape, whioh is often one of no little elegance. In yet another class of caser, the tint, after leing luly shalnd, has lieco cround smooth, or has evon receiven as high a molish as eonld be given by a modern lapidar: "Exampes of all the varieties of tint veanns and implementa will be found in the British Mnseum, in the Museum of the Royal Irish Academy at Inllin, in the Insenm of the Suciety of Antignarics of Scotland at Edinburgh, and above all, in the Musmon of the Iingal Soevety of Antiguaries at Cinewhacen, which is especially rich in this class of remains. liepresentations of interesting or characteristic typus may be scen in the Catulogne of the Archatopiciel Musean at Ettinburgh in 1850 (Edin. 1859) ; in Mr Wihle's Cotulogue of the Antiquities in the Musem of the Royd Irish Academ: (Duh. 1857-1861); in W"ursaac's Fordiske Oldsager i det Kongelige Mushom i Kiohenhorn (Copen. 1859); and in M. Frederic Trojon's liabitutions Lacustres (Lausanoe, 1860).

Genlogical discoteries have recently invested fint imploments with a new interest. It Abberille, at Anicans, at Taris, and elsewhere on the continent. thint wealmos, fashioned by the hamb of man, have leen found along with remains of extinct species of the elymant, the rhinoceros, and other mammals, in mulisturbed beds of those deposits of samet. gravel, amel char to which geologists have given the name of "the elrift.' They so far resemble the tlint inquments and weapons found on the surface of the earth, hut are genomally of a larger size, of rader workmanship, and less varied in shapes. They have been dirided into three classes-rouad. mintel, as in fig. 1 : and sharp-pointed, as in fig. $\%$, loth berine chipped to a sharp edee, so as to ent or pierce only at the pointed end ; and oral-shayed, as in fise. 3 , with a cutting edse all rouml. The first and second classes vary in leugth from alont fons inches to dight or nine inches; the third class is genually alwut four or five inches long, but examplas Gave leen found of no more than two inches, and of as much as eight or niue inches. In no instance has any thint implement discovered in the drift been fonn? cither polished or ground. The French antiquary, M. Boucher de I'enthes, was the tirst to call attention to these very interesting remains. in his Antinuites Celtiques of Anterliteriennes (I'aris, $1545-1857$ ). But it has since been remembered that implements of the same kind were found in a similar jositima at Hoxne, in Siuffolk. along with remains of some gigantio animal, in 1797, and at Gray's Inn Lane, in London, along with remains of an elephant, in 1715. Both these English examples are still preserved-the first in the Musemm of the Society of Antiquaries at London, the seennl in the British Musenn, and they are precisely similar in every respect to the examiles more recently found in France.

To what age these romains should be assigned, is a question on which geolugy scems scarcely yet prejared to speak with authority. But, in the words of Mr John Evans, in his essay on 'Flint Implements in the Drift,' in the Archetologia, vol. xxxriii. (Lond. 1860), 'thus much appears to be estallished beyond a donlet, that in a period of antiquity remnte beyond any of which we have hitherto fomm traces, this portion of the globe was peopted by man; and that mankind has here witnessel some of those geological changes by which the so-ealled dilnvial beds were deposited. Whether these were the result of some violent rush

## FLINTSHIHE-FLOATIXG BATTERY

of waters, such as may have taken flace when the comree of omr lrontis, streans, and rivers, may "the bountains of the great stop" were lubert lue usithr of dispute. Under any cireumstances,

Fhint Tmplements from the Talley of the Somme-Tieduced.
man, been submergel unter frobin water, and an aqneons depasit from : 0 to 30 fent in thicknoss, a pertion of which, at all events. must have subsided from trancuil water, las been formed upon it; and this, too, has taken Hace in a cmontry the level of which is ums stationary, am? the face of which has then little altered since the days when the tames and the lionums constrneted thoir sepulchres in the soil owerlyise the drift which contans these rebies of a far corlher race of men.'

FLI'NTSIIIRE, a maritime emunty of North Wales, bonnded on the E. Dy Choshire and the river Dee, on the S. aml W. liy bemhinhshire, and on the N. by the lrish sea. The main pertum of the comuty is at miles long hy 10 hromi, ind the lareer of the two ontlyiner jurtions, which lies towarn the south-east of the main part, is lomiles hy in. f , is the smallest of the Wrbly qonnties, its area leang only JS4,90n acres, of which $\frac{1}{7}$ th is arahle 'The rinast, 20 mites long, is low amil saudy, lant on the Dee estuary fertile, A hill-range, garallel to the Dee, mans through the length of the monty, and rises in Garrey to saificet. Another ranen along the sunthwest border of the connty rises in Now Fiumma, IS 45 feet. The chief rivers arr the bee, Alyn, ind Clwsd. The chei strata are l'emaian, 'arhonfirmus, and Devonian. Coal, ant oues of iron, leat, silver. copper, aml zine are the chef mimeral problute and exports. I'. supplies a fourth of the leat pronlucend in Iritan. The soil is fertile in the plams and
viales, anl the staple prolnce is wheat, oats, barley, potatoses, cattle, cheose, and lontter. Cotton is the main manufteture. The London, C'hester, and Holybeal liailway skirts the east aml north slores. $F$. contains Ebhmireds and 32 parishes. Pop. (186l) 69,571. About 215 phane of worship (1 I0 Methodists, 41 bipiscopul). l ", seluls two members to parliament. The ehiof towns are Flint, formerly the county town: Mold, st Asaph, Holywell, Ihyddlan, and Itasamben. F. has traces of lioman lead-mines, is traversed by Wat amp Otin's Iykes, and has some ancient castle and ceclesiastical ruins. In $F_{\text {, }}$, in the 7th e., Fiaxon invaders massacred IDOO Christian monks of the monastery of Sameor. In 796 , the Saxons defeated the Welsh here with ilreadful slangtur, which event gave rise to the still popular plaintive air of Mur/u lihydelken. (157I-pop.76,245.)

FLIN'TY \&LATE, of which there are beds in Sume phats of scotlind, and in many other eountries, is an impure quart\% assmong a slaty strueture. It contains about 7 is per cont. of silica, the remainder leins lime, magnesia, axide of iron, \&e. Its frace ture is rather sulintery than shell-like. It is more or less translucent. It passes ly insensible gradations into clay-skate, with which it is uften in most intimate geological combection. Lydian stome (q. v.) is a variety of llinty slate.

ILOATINC I:A'TTERS is a hulk, heavily armed, and made as invulnerable as possible, used

Floating Fattery used in the Ruskian War, $15 \mathrm{if}-1 \mathrm{son}$.
great thickness, and were cowred with sluing roofs, to cause the shat striking therm to glance off innocuously: But their solidity and strencth were unavailing against the courage and adroitness of the A-fenders, under the gallant General Elliot, who succeeded in destroying them with red-hot caunonballs. Steam floating hatteries of iron were constructed for the war with Russia in 1:554, loth by the British and French grwernments; lmt, notwith standing that they rendered good survice before Kinburn, they have since leen generally discarded for other than purely defensive propeses as too cumbrous for navigation, and too suflocating from the smoke that collected hetween their decks durine action. - The iron-plated frigates now made (slich as the $11^{\circ}$ orvior) can scarcely be resardet as Iloating bateries being rather frigates of splembid haill, rendered almost impenetralde by sheets of iron overlying their sides.
FLOATING ISLANDS ,xist in some lakes, and more rarely in slow ant placid rivers. Noit unfrequently, they are formed by the detachment of protions of the bank; the interlaced ruts of plitats forming a falnic sufficiently strons to enclure the oceasional buffeting of watres, and to support suid for herbage ur even trees t" सrow in. Fluating islands are often formed by artrection of driftwood in the creeks and loyss of tropacal rivers, amd being waited into the channel of the river when it is flooded or by the wind, are carrien down to the sea, with the soil that las accummated, and the veretation that has established itsolf upon them. They are sometimes seen at a distance of at or 100 miles from the month of the Ganges, with living trees standing erect upon them. Portions of the allurial soil from the deltas of rivers, held together hy the roots of mangroves and other trees, are sometimes also carried out to sea after typhoons or hurricancs, and ships have, in consequence. been involved in unexpected dangers, as amongst
the iechergs of colder latitules. Imagination has always invested with a peculiar interest the

Straggling plots, which to and froe doe rome In the wide waters;
and ancient legem lid not fail to notice the floating islets of the sacred Vandimonjan Lake, which were large enough to hear away cattle that were tempted mpon them ty their fresh freen grass; ant the island of the Cutulian waters, which carried en its surface a dark and gloomy frove, and was crinstantly chancing its place. A small lake in Artwis, near it Umer, is remarkable for the number of its floatine islands, as are also the marshy lakes of Comacelion near the Ginlf of V"enice. Amonst the largest in the world are those of the hake of Gerdau. in l'russia, which furnish pasturage for 100 head of eattle: and that of the lake of kolk, in Osmabruck, which is covered with heartiful elms. Loch Lomond was long celehratel for its loating island; it, however, can no loneer loast of one, as it has long since sulmiled and berome stationary. Floating islands are foum in some lakes of sootland, and also in lreland, and consist for the most part of large thating masses of peat. Fenmant gives a description of one which he satw in PreanalTrane, the surface of which exhilited phaty of coarse grass, small willows, and even a little lirch tree Mone interesting to the scientific infuirer. as preanding a phenomenon not so easily explained, are those llation islands which from time to than appear and ilisappear in the same spent. of which there is rue in the lake of herwentwater in C'umherlamh, one in the Lake Fialany in the province of smalaude in sweden, and nue in Ostronthia. That in Derwentwiter is opposite to the mouth of a stream called the Catgill; and the most proballe of the many theories which have lnen proposerl to account for it is that which ascrilies it to the waters
 the interlaced and matted roits of the arpatic plants which there from a close turf on the linttom of the lake. This tuating island, when it rises above the water, is most clcvatel in the centre, aml on its leing picreed with a fishing-rod, water has spouted ul, to the beight of two feet.

The marshy ground of the vale of Cashmere and particularly arom the city of Coshmore, comtainine many lakes, and lialle to inmadions, exhibits is previliar form of human industry in its momerons Fiontisu; (fardexs, emploved chefly for the cultivation of cucumbers, intloms, ani water-melons. These floatinf gardens may le described as phitions of the marshy gromel artiticially made to thoat, by entting through the roots of the recels, sedges, and other plants ahont two feet below tho surface, amon which mud is then spreal. The flating of the garden secures the soil and crop from lestruction ly inumbations.

Floating gardens existes on the Lake of Maxico before the conquest of Mexica by the Slmiards. The MLexicans hal made great prosrevs in the art of gardening, and particularly in the cultivation of thwers, which were much usid lonth in their festisitios and in their worship. How they were induced to attempt the formation of thating gardens, and at what preriod it was first done, are mere matters of conjecture. The shallowness of great part of the lake was furourable to the success of the attempt, and perhaps the gralnal receding of its waters may le reckine among the reasons of the sradual diminution of the number of the doating gardens, which have almost ceased to be reckoncl among the wombers of the world. The Abte Clavigero, in his Hivery of Mexico, describes them as formed of wicker-work, water-plants, aul mul; as sometimes more than 20 poles in extent; the largest

The pmishment of thaty, wheh is renerally administerel with a whip or cat of nine tails on the law hack, cannot, under existimg rules, exeend fifty lashes.
Corpmeral punshment is not rocogniseri in the French army; lan then the soldiers in that cometry are drawa liy conscription from all rauks of society, am have, on an average, a ligher moral tone than the British recuita, who, attracted ly is bowty, voluntere asually from the luwest orders. On the other ham, the disciphine in the French army, ame especially during war on a foreign sed, is universilly admitteil to he inferior to the striet rule preservel anoug british trogls. Soldiers and sallors being men buncenstumed to control their passions, and any brach of insuborlination leing fatal to the esprit of a force, unless summarily repressed, it is considerel necessary to retain the jower-however rarely exercisel- of inflicting the painful and hmmiliatiug purishment of flogging. The French soldier, thongh estaping the ignominy of personal chastisenent, is severnel by a cole harsher than our articles of war actually auministered; and the punishment of death, scarcely known in the British service during peace, is mot unirequently visited in Frauce ujon offenders against discipline.
FLOOA-CLOTH, a coarse canvas coated on both sides, and partly saturated with thick oil paint, one side laving ustally a coloned pattern printed upm it in oil-paint. The canvas basis for flloorcloth is chietly mannfactured in Dundee. As it is required to be without seam, and of sufficient widtle to cover consideralle spaces of flooring, special looms are reguired for weaving it. It is made

## FLOOR-CLOTH-FLOOIS

from 18 to $2 t$ feet in width, and in length from 100 to 113 yards.

The first step towards convertiag this canvoas into floor-cloth consists in stretehing it on in frame. 'I'his is a work of some difficnlty, on account of the freat size of the pieces. Some of the frames are as much as 100 fect in length by of feet in luegeht, and the canvas must be stretched over it as tiuht as a irmon. The back or plain sile of the eloth is first operated non, ly prominy it with a solution of size, and scouring it with pumice. The object of this is to prevent too much of the paint from penetrating the canvas, and rendering it brittle, and to make an cren surface to receive the paint, which is mixed with linseed oil, with very little or no turpentine, and is consequently thicker than common paint. This is thrown or splashed njon the surface with a brush; and then with a loner steed teowel the workman spreards the dabs of paint, and proluces a tolerably smooth suface. 'This trouelcolour is left for 12 or $1 \pm$ days to dry, and then another eoat is laid on in a similar manner ; and this completes the back or moler sicle of the flowrechoth.

While the first coat of the back is drying, the front is primed and pmmiced, and a coat of trowelcolour laid on. As more eare is required on this sicle, this eoat of colour is scoured quite smooth with pumice, and two more trowel-colours are added, and each scoured like the first. Another cont is now carefully laid on with a brush, aml is called a brusticolemr. This furms the gronad nomen wlicen the pattern is to be briuted.

The printing is done ly means of wool-llocks. The pattern is first drawn and painted, in its complete form and colours, upon a jece of paper ; another piece of paper is now lairl uncler this, and the outlines of that portion of the patterm inelurled in one colour are pricked through to the lower paper. In like manner, pricked outlines of each of the other colows are prepared. Each of these prieked sheets is laid upon a block of prar-tree wood, and dusted over with pownlered charcoal or lampulack, and thus the pattern is drawn in dots n1on the wool; the carver cuts away the wood surromading the pattern, and leaves it standing in relief.

The pear-tree blocks are backed ly gluing tlom to a pieee of deal, and this piece again to another, with the fibres at riglat angles, to prevent warping.

The colours are spatid by boys upon pablicer cushions eoverel with floor-cloth, and cach printer rlabs bis block upers that containiner the required colour, anl then places it ayon the homereloth, and striking it with the landle of a short heavy hammer, prints his portion of the pattern. Ife then proceeds with a regetition of this, and as hes adrances. he is followed in order by tha frinters of the other moms, who place their honcks accurately over the pattern the first has cummenced. " ${ }^{\circ}$ he first printur": clvef care is to kevp the repetitions of the pattern itceurately in lime.

The quality of thoor-cluth devemis mainly mon the mmber of coats of paint, the kind of mertion used for the colour, and the time siven to drying. Fior the best qualities, a fortuiflat must rlape between the laying on of cach cont, and dimally, several months' expusure in the drying-rum is hecessary. As the rental of the space thus vecupied, and the interest of the capital left stacmant during this time. amount to a consjilerable sum, there is a strong indlacement to mamfacturers to hasten the procusses, which may unsly be doue by nsimg gold size or hoilen linseed oil, or other rapin " iryors," instend of raw linsece oil; but just in propurtion as the drying is hastencel liy these moans, the ducability and tlexibility of the thoor-cloth are leterionated. In
order to secure the maximam of durability, flone cloth shonld still be liept three or four years after it has left the drying-room of the manufacturer, and purehasers should always select those pieces which they bave reason to believe lave been the longest in stock. Narrow Hour-cluth, for stair-carleting, passagus, de., is made as above, and then cht into the requirel widths, and printerl. It usmally has a larue pattern in the middle, and is border of as smallen tesign.

The laying of loblies aur passames with eneaustic tiles has lately lal to the superading of thoor-eloth in such situatious, while for somue othor parpenses, such as covering the Hoors of churelies, readingrooms, aml waiting-rooms at railway-stations, it is superseded liy the mewly inverted matoral called kamptudicon, or voleaniserl India-rubber eloth, which is impervions to wet, soft and quiet to the treme, and warm to the feet. This new material is made plain or tigned to resmble painted llour-v lotis.

FLOOR: WhOORING, the horizontal pratitions hetween the stories of a building the under part of which forms the floor of the apartments above, and the lower lartion the ceiling of those below.

Floors are varimusly construethd, aceording to their dimensions, and to the weirht thoy have to sustann. Single-joisted foors are the simidest and most cheaply constructed, and are used for ordinary homdinus, where the distance lotween the learings does not exened 29 , or at nose "! feet.

The annexerlfintire represents a section of a singlejoisted How, in the line of the Hoorino-boards, amd acoss the joists. These joists are beams laid edge

$a, b, c, d$, the joists; $e, f$, the fonrinc-boards; ig and $d t$, herrmin-bone strutung.
mpradeds, and resting at their ends upon wall-piates mailt into the walls. Their widtl! shonld pot le less than two inclues, for if namower, they wnuld he liable to split with the naliner of the flowing-lowards. They are placed colere upwarls, in urler to connumise timber, as the strengtl of a luan to luar a transverse strain varios simply with the lrealth and with the soluare of the degoth. see strafxetir of Daternals. Whem a deep amd Jome joist is used, there is claner of its twistima on turning ofer ; this is preventerl lyy strutions, that is, malines eross picees of wom lutween tho m , as shewn between the joists $c$ and al of the timure, of less fllectually, by driving pieces of planking letween then. Strutting is required when the leninth of the joists exeeeds cight fert. The lathe fur the ceilins of the roon lubw are nailerl to the lattonn of the joists. In genul sulastantial work, the distance between the joists from centre to centre is about 12 inches, lut this is often exveeded in cheaply built houses.

Jouhbojoiskel hoors are constructen hy laying stronsthnhers, called himling-joists, from wall to wall, at a clistance of about six foet apmet; ame a donble sut of joisty, one above for the thon, and one helow for the ceiling, are laid acruss these, and notched down upon them. 'l'hese latter, when thus plaeed, are called brifgingoonsts, as they limge orer the interval between the larger hinding-juists. This is adopited when a more perfeet eciling, free from cracks, probluma by the jideling of the flome, is required, or where there is a diftienlty in olpaining a suthicient amonnt of long timber for single juistin: the whole of the tloor.

The framel thoor is one degree more complax

In France and most of the sonthern emtmental comotries, where carpots are rarely used, the floming-hoarts of the hetter class of homsiss are made of hard wood, carefully and closely jumtm, and these flurs are commonly ruhbed with lues-wax, and polished. In humbler dwellings, even the leotroms aro pavel with tiles, or strong 3lastur, wemertw : and considering the prevalence of thas, \& © in such places, the $y$ are certainly bettor adinted for them than cur deal-hoats and carnets. Thuy may be freely sprinkled, and even swill d with water in hot weather.

Pur wathonses where leary goods are stored, for ball-rums, \&e., suecial construction is required to allapt the floor to the strain put unem it.

Flo'lit, amung the Fomams, was the name of the sthdess of thwers and of the spring, ant was latterly ideutilien with the Cireak Chlemis. IIer temple was sitnated in the vieinity of the Cicces Musimus. The worship, of F . was rine of the whest manifestations of the homan religins feeling, and is atfirmad to have be en introduced ly Numa. The: Fharalin, or festivals in hanor of the genleses, were first intitutal 238 r. fi. and wore celelorated from the esth of April to the lat of Nay, with mueh lecontinns sumant, protitutes playing an impertant pate on such wecalams. On coins, F . is represcnted with a crown of ifowers,-In Butany, the term lorrit is a collertive mane for llants, aml is used with recarel to the vegetable kinghom in the sanme way as the torm Finmen with regaril to the ammal. It is common to suak of the P'lara of a conamy or district; and at work devoted to the
hotany of a conntry or district is often entitled a Flora of that region.
 former kinerlom of Tuscany, is sithated in the
 1115 F . It is abont 123 feet ahove the leved of the sea; 60 miles from Leghorn, 40 from sienta, and 44 from Arezzo. Pop. ( 1571 ) 167,093. The Arme, spaned by four fine bridges. divides the city into two mergiad pats, the chicf of which atanls on the morthern hank of the river. In shap", an irregular puatagm, $F$. is cuclosed by walls of ahout is miles in extent, and commonicathis with the extcrior ly means of eight gates, which conduct to thickly prophed suburbs, and a lowely, fertile, and saluhrions neighborlood, enciredel hy sloping hills, and studded with pieturesune vilias and fruitful rincyaris and gardens. F . :mit her envirns, viewed from the heights of F'insole, apmear lut wae vast city: Many causes ronder this city a most attractive place of residunce to forcigners-a lovely country and healthful climate, cheap living, and the unisersal courteous intelligence of the prople, umited to the immense sourcis of interest prossessed ly the city in her Erand historical monuments and collections of art. The massive and anstere forms of Florentine arehitecture impart an air of ghomy gramleur to the streete, for the most part regular and well kept; but in the many fouds and civil convulsions of the city, these domestic fortresses were suljected to severe regular sieges and attacks, which highter amb more derant structures conld have ill withstood. The chiof monuments of the city are 11 Duoms, or the Cathedral, the fommations of which were laid with great solemnity in 1098. The NJorentines laving ambitinasly resilved un erectine a momment which for arehitectural splendour and froportions should outric all preceding structures, the honour of preparing the design was intrusted to Amolfo de Cambio da Colle. On his death, Giotto superintended the works: and many eminent architects were employed before this splendid edifice was com-phed-Brunclleschi, the last, ennceived and erected the grand cupha, so moll admired by Michacl Angelo as to have served him as model for that of St P.ter's. At the side of the cathedrai springs up the light and ehegant hell-tower, detached, acending to the custom of the times. Jo front is the Baptistery of san Giovami, in form an netagon, supporting acufuland lintern : all three edifices being entirely conated with a varied mosaie of llack and white mathl. 'Three bromze gates in hasso-rilievo are a great allitional alornment of the Baptistery; the Ewo by Ghiberti have heen immortalised by Nielacl Angeln with the name of Gates of laradise. Siee Sgrili's description. The church of the Sauta Croce, the Panthen of F . (1milt in 1004-architect, Arnolfo), contains momuments to fralileo, Bante, Machinvelli, Dichacl Angelo, Alfieri, \&e. The church of San Lorenzo was consecrated as carly as 243 liy St Ambrose, and relmilt by brumellaschi in 1425, by commame of Giowann and Cosmo de Merici. It contains an interesting monumental memorial of Cosmu il Vecehio, hearing inseribed the title Pater l'utrit, wheh hat beco emferred on his memory liy public sultrag the year follow. ing his death. In the Frame sitgrestion, or New sacristry, are the two famms momuments of Aichad Angelo to ,Inlian and Lorenzo de' Aedici. The figures of these two statues are marvels of Terp and living expressiom, and unsurpassable in therir mate nan elequent beanty: The Mediconn chapel, gorgeous with the rarest marhles and must custly stones, agate, lapis lazuli, chalectony, E.e, stand luchind the choir, and contams the

## FLORENCE.

tombs of the Medici family, and those of the grand dukes their euccessurs. Annexed to the church is the Laurentian Library, witl its inexbaustible store of rare MSS., founded by (iinlio de' Medici. Bamdini has pmblished the cataloge of the Greck, Latin, and Italian MSS. ; and biscioni and Assemani those of the Helorew and Uriental unes. Amongst the mamerons $\mathrm{p}^{\text {nalaces, }}$ Il Liturgho, now converted into a prison, is one of the must ancient, and was formerly the ahode of the remblican manistrate, the l'odestic. In IS41, sume interesting portraits were brought to light loy the removal of a coating of whiterash from the revered features of Dante, Brunetto Latini, Curso Ihmati, \&e., in the chapel of the palace. The l'alazzo Vecchio. the seat of the remblican government from its estalbishment till 1530, when it was abolisued, is an imposing mass of halding, surmounted ley a lofty tower 200 fect high, the great bell of which used to warn the citizens of danger, or summon them to defence. Adjoining the palace is the l'iazza del I'alazzo Vechio, a square containing a fine collection of statues, am a noble areade, the Logyia de Lanzi, under the portices of which are magnifie nt groups of sculpture (see liastelli's Illustrazione Storice ded Palaza della Simporia detto Peduza Veachiol; (ili Uffizi, a handsome bmilding between the Pilazzo Vecchional the Amo, funded hy Cosmu I., in the first llow of which are deposited the archives of the court of justice and other puldic otfices, also the Magliabechi Lilnary of 50,000 volumes, and $\mathrm{O} \because, 000$ MSS. On the second Hoor, in a circular suite of 23 rooms, is contained the famous Florentine gallery of art; rich in paintings, engravings, seupsture, bronzes, coins, gems, and mosaies. A splemidid apartment, known as the Trilma, contains the rarest treasures of the collection, and is in itself a wooder of art, with its cupola inlail? with mother of pearl, and its rich martle prement. The Palizzo Pitti, the modern grand ducal residence, housts of a superb gallery of paintings, and of a collection of 70,100 rare volumes, and 1500 Miss.

The Palazzo Jiceardi, now public property, is much frequented for its fine library. The lalazzo Strozzi is a fine type of Tusean architecture. Florence abomds in other pablic edifices aml monuments well meriting notice, but our limits nblige us to omit all mention of thens. The practical and philanthropical institutions are also numerons amd excellently organised. The hospital of Santa Maria Nuova cuntans a college of medicine and surgery, which eajoys a Enropean fame. The Academy of the Fine Arts and the Masom of Natural llistory atlord unlimited resources to the public interestel in their collections. There are three hospitals, owe lumatic asylum, nine theatres. The Acallemy della C'rusea, is intrusted with the care of sifting ant preserting monrmatel the Italian language, The feademy lei Geurentili was astablished in the interests of immolture, the 1 rogress and neuls of which it rejorts quarterly in the Giomacle Atprario Towano. Fur a netailed description of Jo, see Guilu dollet ritted di Firmee, 1 Sis. The chief imlustrial occumations of the Florentines are the fabrication of silk and wrullen textures, and of straw-plating for hats, \&c, jewellery, and expuisite mosaies in rare stomes. Enncation is more diffused in 'Tuscany than in any other Italian state: and the Florentines are fanous for their canstic wit, and matmal gifts of eloquence, as well as for their shrewt thriftiness and unttagging labour. In their moral superiority to other states may be recogmised the effects of a hetter and more uright government than those which existed in most of the other divisions of the peninsula previous to the late partial union of Italy.

Mistory of Flornce.-The city of F . sprand originally from Fiesole (1. v.), at the font of which it lies extemdel. The inconvenient and hilly site of the Etruscan lijesole, freded on the crist of an irregular height, rendered the town so bifficult of accens to the tralers who resortel to its market-places with their varied merchandise, that it was at leneth deereed they shomb assembly at the hase of the hill, in the furtile plain traversed by the Armo. The few rough shelters creeted for the accummenlation of these tralers may be consinderal tha miginal maclous of the important and splembin wity of Fhorence. Such at least is the tralitionary listory of it.s migin genurally accepted by the Flarentiue histurians. It would seem that as early as the time of sulla theme hand been a lioman colony lere: annther was sant after the death of Julins Castar, and it som leean" a thriving town. The Florention are mentaned ly Tacitus, it A. do, as seming delegatos to Lime, luit it was not till the time of Charlemane that E ", herg to rise out of obsenrity. It was now momern by a malitical head with the title of Inken, assisted by various subordinate oticers, who were clected liy the united suffrases of the duke and citizens. In the l1th e., ${ }^{\text {r., and a great part of Thscany, weme }}$ bequeathed to Poje Gresery TIL., by his frimen and partisan the Countess Matilia, who inherited from her mother, the Countess Beatrix, her jurisdiction wer the city. I'ander the protection of Ibme, F. specelily adopted the forms and institutions of a free city; and the repubican spirit which then arose amonest the pople imparted an impulse to national and individual life, and awoke a spirit of ardent patriotism and splemill enterprise. As early as the Ilth c., the Florentines were European traders, and the passessors of grand commercial depots in the seaports and cities if France and England, and their skill as workers in gold and jewels had grows proverbial. In proportion as papal preponderance inctased in F., that of the empire sank; and in J113 the citizen fores routed the troops, and slew the delegate of the emperor at Monte Cascioh, near Florence. During the bitter wars between pope and empire, F . and all Tuscany seemed to have been saved from the civil funds which raged thronghout ltaly latwen the contending factions of Guelphs and (ibibellines; the fommer, wherents of the pope; the latter, of the empire. Jout in J215, F. became involved in the great party strugele, owing to a private fund hreaking ont betwecn two noble families, chicfs of the ententing principles. A Guelph noble, Enondel. monti, mortally incenser the chibelline family of the Amidei, by breaking ofl his alliance with a daughter of their house, and contracting marriage with a member of a Gutphe family: To avenge this insult, the Amidei appeated to their powerful kinsmen, the Cberti, and, in fact, to all the Ghibelline party of Florence. Buomdelmonti was stabled to death as Lu* erossed the bridge of the Ponte Vecchin, aml was spedily avenged ly the Guel phs in the hood of his nemies. Thus for 33 years was F. distracted ly the deeds of bloorshed and violence of these twa rival factims, who assmued the names, and adopted
 Guelrif and Ghbeline. In Jo\%o, the mimosity of these parties scemed somewhat hlunter, and pmblic attention was directed to wise intemal reforms. Twelve magistrates, or amiani, were alpminted in phace of the consuls, each of the six suctions into which the eity was divided being intrusted to two of these magistrates, whose tenure of oflice was annual. To avoil all local dissensions, two other magistrates, strangers by birth, were elected: the one, investel with supreme authority in ciril anil criminal eases, was called the polesta; the other, with the title of captain of the people, had the chief

 top pioces in the sabumary bettle of Alonte Aperto. 'The conducren enterel 1 's forthwith in the hame of Mantreal, almhshat all trace of the repmar institutions, atablishing on exchsively aristor ratic -xentiva amb cren strongly alrocated the entire lestruction of the eity, the buthel of Guelphism. 'Hhis latharuns scheme' was indignantly' repuliated In their uwn famous lealer, Farinata deali Elorti. immortalised ly Dante fur his patrintism. He declaret his intintion of heading the Guedphs, were such a saterilege perpetrated by his own party. Pope Crban IV., French by birth, summoned against the (inilelline Manfred a Fiench army, led by Charles of Vilus, to whom he ofimal the prespective kingetm of the Tro Sicilios. Manfred was defentect and dan in the iamons battle of benevento, aut Gaclphasendeney was restored anew thromh ont lably aur Fhrence. Charles fully restored to the Florentines their internal institutions, and recerved their wferel allumee for ten years, 1266 . In 129, the Priuri, a new execntive power, was estahlished in F.; and in 1203, by the consent of the Primi, a higher chiof than their own order was elected, with the title of (imblomive In 1300, Dante beeame one of the I'riwri, ant the former iend was recommencel with new vigour between two factions, whe bore the names of Bianchi (Whites) and Neri (1hacks). Their dissensions were, however, interraptel by the arpearance of Charles of Valois, sent he Loniface Vlli to restore tranquillity, $1: 301$. Charles espousel the part of the fuelphs or Nori, amb sanctioned efery ontrase on the Bianchi, who were phonderel ami mulered barbarously, the survivors laciag exilel and bespored; among these were lonte, ami I'etraceo dell Ancisa, the father "f I'etrarca. In 13ak. I'istoja was besiened, and takul ly famine with great barbarity, In 13:1. the Fhontines met with a screre check from the thitullines of lisa, under the command of Ugocrinue della Faycula ; and in 1325, were completely - lefeated liy Cobecione's snccessor in command. the valiant Castruceio Castracani, in the battle of Althascio. l', wakered ly long dissensions, and abumed hy ('astruccir's theat of marehing on the "ity, appetled to the kins of Naples for aid. They rectiod joytully an wher of the king, entitheil the luke if Athens, sent as royal viear; and such was the pablic demorahsation of the moment, they [rictiamed him dictator of the repmblie, maminomsly anpressing the othess of prion and gmfaloniore The intrigues of this imoble schemer to overturn the rumblie befur descrvered, he was ignominioudy exprled by a gromal phlular rising, and marrowly
preservel his life. An attemp to admit a promar tion of the mohles intor the gotermane simatly fathed at this time, and only led to renewed aniunsity lectwen them am the citizens. This was the list afturt of the molhes to secure power. See Nabhavelli, look ii. A terrible pest decimated
 Se lincomen, Derameron. The chief puwer of $F$. ahont this time scems to have heen altamately wieddel ly the democratic faniliss, the Alherti and the liece, and by their patrician rivals, the Albiza, who, fin the space of 5:3 years, guted the rematio in the proth of indenemdence and progress. In 1406 , the macent and illastrinas republic of Pisa ( q . v .) fell und the sway of $F$, after it most heroic resistance. From 14 H , the histmy of F . is intimately loumd (a) with the House of Medici, whose influence supplaited that of the Albizzi See Medicr. The Sledici were rematelly hanshed from $F$., in consefrence of thei: aming at sovereisn power ; and to their intrignes F. owes her timal loss of republican rinhts and institutions. P'ope Clement \"II., of tho House uf Methei, furmed a league with the Emperor C'harks V., by which the likerties of 1 . were to be extmpuished, and the soveren power to be invester in the poper's bastard son, Alexander de' Medici. In September 1529, an amy of imprialists, under the Duke of Orange, coteret Tinseany ; and on the Sth of August 15\%0, the siege of $F$. terminated, after a defence of tuesampled devotion and bravery on the part of the citizens. Thus fell the name and form of the repulic of F'., quenched in the best bloond of the city, a sacrifice $t$ or a reuegade jope, who emploved both foreigu rolbers and internal traitors to destroy and humiliate the city of his birth. From this periot, F. loses her tistinctive history, and is ondy known as capital of the grand duchy of Tuscany I'pre Clement having eonferred on Cosmo de" Nedici the dacal disnity. Some idar of the splembour and proserity of $F$. as a repulbic may be hai from the fact, that her capitalists were so chormonsty wealthy, they supplied the ehiaf sonerefus of Linone with fimids; her manufactures of worl, silk, and gold browle were exported throughout the word; and besides home centres of coumerce, she pussussed great conmercial establishments in all the conntries of Earope. This womburin prosprity the Florentines owed solely to their indomitable spint of enterprise. (Florence was for a time the capital of the new kingiom of ftaly, wat in ISTI had to yied the honour to Iome.)

FLoribs, as the name of varions isfand ocemes in Asia, North Auperica, Sunth Ameriea, anel the Azores.-1. In the Malayan Arclipulato, about half way betweon Java and the eastem extremity of the chain. It lies due sonth from Celehes, stretehins in $S$ lat. from $S^{2}$ to $!^{2}$, and in E. long. from 120 to $123^{\circ}$. Like most members of the group, it is of an oblong shape, mensuing 000 miles in tength by an arerage breath of is. In common with the rest of the duster, the istand is of hilly character anl voleanic origin. It produces motton, sandalwom, and loces-wax; and its princigal trade is with Sincapore.-2. ## FLo'ret. See Flowir.

FLORICULTURE, or CULTIVATION OF FLOWERS. From the carliest times, and wherever any considerable progrtss has been made
in civilisation, $p^{\text {lants }}$ lave been cultivated for the sake of their beautiful or fragraut thowers. Flowers have been very gencrally amploynd not ouly to afford gratification, and for the adomment of the person and of honses, particularly on festive oceasions, but in many countries also in eonnection with religious rites. Flower-markets existel in aneient Athens, as in the richest eapitals of the motern world. India, China, and Mexico have been famons for the cultivation of dhwers, from the earliest periods to which their history ean be acenrately traced. Artificial means have hers craployed for the protection and cultivation of delicate exotics, mized only on account of their llowers, far more generally and assidnously than for the cultivation of any fruit-bearing, culinary, or otherwise uscful plants. Those who cammot afford more them a very small green-house, almost always devote it to Howers; and those who caunt attain even this, have a few favoured plants umler a frame, or at least in a window.

Flowers are either cultivated in horders of a garden mainly appropriated to fruit-trees and eulinary vegretables, or a separate flower-garden is formed, consisting generally of parterres cut out of a lawn. Of late years, the separate flower-gardeu has become much more ermmon than formerly: There is mueh room for the display of taste in the form and gromping of its partorres, and both in it and in the humbler Hower-horder, in the arrangement of the tlowers themselves. A common rule has always been to place the phants of tallest growth generally at the greatest distane from the walks or alleys from which they are to be wewer, and those which searcely rise above the gromu, nearest to the spectator: it is also of evident importance, except in extensive gariens, that every border or parterre should be gay with flowers during all the spring, summer, amd autumn, on which account attention must be pail to the intermixing of plants that Hower at different seasons, and for this purpose ammals are often sown amongst peremaial plints and shruls; whilst it is always necessary to take care that the combination of colours be such as to please anel not ofleud the eye, in order to which complementery colours are brought threther-ral and green, hilue and orange, yollow and violet-whilst a judbions mixture of white hends and harmonises those which would otherwise appear unpleasantly contrasted. This rale is crually applicable to the grouping of flowers in one border, or of parterres in which masses of the same culour are exhinitel, often proluccel lig an extensive planting of the same flower, a practice which has recontly become common, and by which the greatest sutcodour of general effect is problucel.

The flower-garden refuires the same attention to the habits of particnlay species, and the same assiduity in digging, cleaning, \& \& which are requisite in other departments of horticulture. Peremial herbaceous plants gencrally recpuire to be not unirequently renewed by parting of the roots or otherwise, is the tuft extends and the flowering stems become more numerous, but weaker and less productive. Many planta are placel in the flowergarden in summer, which require the protection of the frume or green-house in winter.

In no department of lorticulture have greater changes been effected by cultivation. Eveu the practised eye has often some difficulty in recognising the splendid varictics which the florist lias produced, as the progeny of the unpromising original form. One of the most common effects of cultivation is the production of domble flowers, in which the stamens have been convertcol into petals,
as in roses, so that if the flower is perfeetly domble it can produce no seed by itself; or, in the case of eomposite llowers, the thorets of the clise assume the sane form with the florets of the ray, as in dahlias, asters, \&e. Nuch improvenent has leen effected by arossing, not so frecpucatly by the real bybricisation of different species, as by the iutermixture of artificial varicties alreacly witamed; and many of the finest varieties are the more rosult of the earcful selection and cultivation of inflividual fhats of superior beauty, and of their promeny:

The green-house, conservatory, stove, ofre, in whinh cantic flowers are cultivated, are muticel in somate articles. But perhaps this artide would not le complete without some notice of window-ghenh mimo, by which a eharm is added even to the ahoules of the wealthy, particularly in cities, and by which even the poor lave the delight of teming a clance pxutic on two, and beconing familiar with the leaty of their thowers. The care roquisite in wimbow fardening is the same as for plonts kept in flow-r-pots in the green-honse; there must be the sume re-potting, pruning of the roots, \&e., from time to time, and at least as much attention in giving water and air. Of the fomer, the most ommon mistalie is to give too much, amil of the latter for little. It is a grod rule, that except immediately after water is given, it should never be sucn in the saucer; nor should the earth aphear very moist. The situation, however, being in many reppects less favomalle, many plauts, as heaths, which are frequent in green-honses, eannot les shecessiully caltivated in the wintows of apartments. The common notion that the burning of gas in apartments imjures window-plants, does not appear to be well fommed. Wardlas Clase, by means of which many dulicate plants are proinceil in the greatest perfection in the wimlows uf apartments, are noticed in a sequate article.
Jlorticultual Sucieties (q. ©.) have of late dome much for the cneouragement of the enltivation of fluwers, and particularly among the hambley chases of society, with evident inerease of amenity within aml around their aboles, and on tumestionathe tendency to retinement of habits and fechiogs.

FLO'RIDA, the uane of the most somtherly anl most morly tropical member of the I'nited States "if Korth Amoriea. Includince its aljo? cent islands and its reeflike chain of keys on the surth-w"st, it stretches in N. lat. lutween $25^{\circ}$ and $: 0^{\circ}$, and in $W^{\circ}$. long. between $80^{\circ}$ and $57^{\circ}+4^{\prime}$. The great portion of it forms at peninsula stretching south-sonth-east towards the liahamas, having the Atlantic on the one side, and the (inlf of Mexico on the rther. It adjoins, on the north, the states of Georgia and Alabima. Its greatest breadith, from the Atlantic to the river leridido, is 360 miles ; its greatest length alout 400 miles; thas averace breadtif of the peninsular portion mpards of 120 miles; area, 60,000 sruare miles. The pritucinal rivers are the st John's, ruming northeast through the peninsula, and enterint the sea near Jacksonville after a course of 310 miks; the Suwanee, flowing south from Georgia into the Mexiean Gulf at Yaeassar Bay; the Ahmachicula. the Choctawhatchee, Escamba, anl 1'ritido. The principal towns are Tallahassee, the scat of government, situatel near the midtle of the northem houndary ; St Mark's on the Ciulf; St Augustine on the Atlintic, the Spanish capital, and the ollest settlement in Anglo-Saxon America; and lensacola, a port near the Perdido, in the extreme west of the state, recently rendered so conspinnous in the war of secessiou.

In physical character, the state, gearally speak. ing, is prart of the sandy and marshy belt whicl:

 14x, is in lanan ior it extedued to othet countries, Proularly in Englad and scotland, when the thatou= letsecutima drove many refugees to the Betieb hutes; and to this day it prevails most of
all where the branches of manufacture introduced by the refigeres are carriel on. In tha little gardens of opratives in some of the mamfinturing towns may he seen many of the finest tulips and carnations in lbritain. It is still, lawever, in Ilollam, aml particularly at llaarlem, that this hrand of gardening is carried on to the ereatest extent, and it is from that guarter that the marke of the world is chielly supplial with hulbs, soml. \&e. lectween Alomsif and Leyonen are more than twenty ares
 in a loese santy sail. The cultivation of roses at Nowrdwyll, in South Idallamd, is ramed an in considemble fiobls situateol in the domes, ame atherds surpert to many faniliong. bertin has of late yars frecome the seat of a dhwer-trank, which partably rivals that of $1 l_{\text {ull }}$ imd. Rome fhowers, ass dathlias and hollyherks, are prodned in greatest perfotion be lisitish cultivators. The "himisp have hat thein florists' Howers, emadins, hydranget the peoning, de., from time immemarisl.

In the yars 1636 and 163 an extmandmary flower-mania prailed in Holland, chatly with
 we have recently seen them do in ralway shares. Bullos were sold for mommes smas. For a simgha
 paid, and for three such twether, :o, o(n) florins, The ownership of a halls wats eften diviled into shares. Then shld lmbs, whith they din mot perssise, on cundition of delivering them to the hayers within a stipulated time: and if some varicties, far mome bulhs were sobl than actually existed. But theme extravarances suon ceaserl, althongh not till they hal invalved many persons in rain.- It was mot till ahout the year 1766 that the real dower-trade of Holland reachol its veatest importance: from which time it has rather de clined. New varieties of tulips and hyacinths are sometimes markne in the Haarlem catalagues at priees frou e.j to l.0) therins.

FLO'l:US, generally, but on insaflicient evidenee, called L. Anmeths $F$., was a Itwman historian who thourisheal in the reign of Trajin or lladrim. Of his life we kinow ahoblately nothing. He wrote an epitome of Ioman histery (Eyutome de liestio. Romenorum), from the fimmlation of the eity to the time of Augnstus. This work, which is still extant, is carefully and intelligently compused, hut is disticured liy an inflated and metaphorisal style. Since the ctition frincops-if, indend, it be suchprinted at the Gubome in 1171, Fis eppitme has been publishel tincs withont mmber. The laest memern eatition is that of Indicrns (Las. Bat. 17:2, 174; Laij. 18:3).
FLOTANT (Fr.), used in Hevaligy to express that the object is flyms in the air, as a banmerflotant.

FLOTSAM. Wreck, in the leral acceptation of the worl, is goods which. having been scattered ley a shiproeck, have foated to lanil. From roods in the posithon of wreek are distinguished these known t, the law of England by the uaconth cxpressions
 gools contimue lionting on the surf:ce of the waves ; the second is where "heing east int" the" sa, they sink and remain under water: the third is where they are sunk in the sea, but are tied to a cork, hather. or huoy, in order that they may loe recoverel. If no owner appears to cham them, goors in these various positions go to the crawn, so that ly a royal grimet to a man of wrecks, things fletsam, jetwain, or lizuen will mot pass. See JerEsm, and Jerrisos, an important term in the lawmerchant, from which jetsam must be carefully: distinguished.

FLotZ (Ger. Ind ), the name given by Werner to the seemdary rocks of Lhmim, lecanse, in the district in which ha exammed them, they were horizontal. He arrangel the rucks which form the solid crust if the wath into finer clases. I. 'Jhe primitive bels without wrganic: rmans, surh is granite and gnciss: 2. The transition slrata, which, from their more of less metamophic combition, wore related to the primitive rocl:s on the one sile, and From their few eontained oreminos, to the flitz on the other; 3. The flotz montaning all the sedimontiry rocks, from the cond-nuasnow nu to ame incluting the chalk: and 4. The newor strata, which he called the 'owerflowed lime' or alluwime. When the followers of Wermer fomm that the horizental position of the flot\% was a lowal aceinont. they abmadonel the term, aud resterel Lehmann's title of sucomblary.

FLOUNDER (Phethese), a meme of tishes, of the Flatfish family (l'humedidef), having ane row of ontting treth in each jow, and wencrally purmentbike: tieth on the pharyas; the dhesal amd anal tims extembing nearly the whme lemeth of the holye the chasal not coming finther forward than the centre of the werer eye; the tail-lin distinctly separatend loth from the forsal and the anal. The this gemes lelong the llaice, Flomer, Wal, \& \& , of the Jritish
 ( $P$. I/sish), is very common, mit only on the British shores, hat on these of most parts of Eurupe. Its Swedish mane is Flumbra. Its soottish mane is FYoula or F'wke, a name which, with ahhations, is "xtemand to many other kimes of that-fish, The
 lirealth, withant the fins, is alout onc-thire of the whole longth. rather less than that of the platee. It in casily Jintimenish from the haice ly a row of small tubereles on each side of the lateral fine. The cobur varies acowding to the gromed from which the bish is taken. The l'. is fumbl chiefly in rather shallow watur, with samly or mudly hotton, and mually in the most perfectly salt water and in the 1 rackish water of cotherics. It asemps still riwers intu perfectly fresh water, and may be kept in freshwater ponls. It lives long out of water, and is easily transferred to pmis.- The F., hike the other tisbes of this grmis, generally swims on the left side, and has the eyes on the right side; lut reversed specimens are of frephent ocenrence.

FLOT'R is a pirpular name wiven to the finer purtime of meal or pulverised grain. Thus, fumer, or whetplome, is the time jrate of gromul wheat; pu-four, of pease, \&c, Suctinem.

ILOUR, ST, a mall town of France, in the department of cimatal is finely situated on a steep basaltic platean at an clevation of 300 feet, 24 miles east-north-east of Awrillac. It is entirely built of lava and hasalt. Its strects are marmow, and its homses in general have a misuable, lark, and dirty andearance. The principal luthus is the cathedral. A sulurh lues at the foot of the rock, and commmicates with the town ly a winding roal ent in the rock. F. has manufactures of hollow

 Maurcillan, Hérault. After having obtained his dearee of Doctor of Mulicine at Monturllier, at the carly age of 10, ho jruceedel to laris, where he soon hecame acpuanted with the Cuviers, Ceolfoy St Hilaire, and w,ther eminent naturalists. For the last forty years, l. has been a voluminous writer on human and comparative anatomy and physiology, on natural history, and on varions special departments of the history of the natural and plysieal seiences.

 the maty of the hanaz lace, ly showath that we

 sementific hamerphies.
 on 'The 'Physum, weal Theory of sencations.' and Fresertem sume of his tirst scientifie contriantions to the dealemy of crienees, into whieh herly he was ainittol as a mombr in 1825. Abuat this hate. he was anm inted assistant to Cuvier ; and in 1803, he sucerded to the full dutes of the professorship of natural history in the Jardin in hoi. In ls:30, he sucoredad bulong as Perpetual Secretary of the Sembomy of sciences-an office which he still continaes to discharge ; and in 1840, the Fronch dearmy elected him a member. He was made a jeer of Frame by Lonis lhilipte in 1546, ant was appointed professor in the Collerge de France in lsis. He is innustionaly the most pombar Frumeh scientifie writer of the present day:
FLOWER, or BLOBsOM, that fart of a phanernomons phat in which the orgens of repmothetion (ntumens and pistils) are situated, amd which consists issontially of a single gronp of these, generatly surronmed by doral wretopes (the coly and romellen). Thath the organs of reproduction and the themal arehpes are motanmphosen leaves, and arise in tucessive whorls from a much shortemed axis, catled the thetemus (tir. a muydinh-hed), or torthe (Lat. it comely). Flowers are sometimes elosely atacled tor the stem or branch from velach the crow, and ane then sail to lowsoside (hat. sitting): inat sometions there intervenes it fantorntald ar duntr tithem simphe or lranched. The whole semblacge of towers of a Ihat is called its Inforatnep (y. v.), and the elifierent limes of inthr-- cence, or moules in which the howers are pow rucel and whupel, are often ats chometeristic as the diversities in the fl wers themestres, athmugh the latter are in eneral mone innmatas with reme eace to lotanial atbinities.

In the vely large natural nitur Compont many
 and surombled with thers in the form if an i.poltore, as a single flowe is summonded ly its "alyx. The haded ulumerai in this case jopularly
 which it is compeneld are loy hotansts stylet forfo. This toma is also applied to the immilual
 the ghanes are it common inwhere.

The urder of the whorls in howers is invarialith: the Calys ( $4, v$ ) is always exterion to the comat (I. . .) : withon the corolla are the stomens (4. w.) or mate organs of roproduction, and in the eontre of
 duetion. In outer calyx, or whonl of metamorphosed
leaws, extorion to the calyx, and nsually smaller, is fond in smme foncors, is mallows, and is called the equctulys. Wathin the corolla, there is smanthe san whitional or sumpmentary corolla, cabled

Inin. tation of sume of the lerincipal Parts of a Flower (from Lalfour's Botany):
1, Sietunt of the firwer of Rammenlus, shewing sepals, petals, mameras stamens, with adnate anthers, phaced below the pappels. 2d Anatropal seed of Aconite, cut vertically, shewing atmulat honngenerns albanen and a smath embryo. 3 Dherram of the Rower of lanunculus, with flee sepmis, the vetals, mumerous stamens, ind carpels. 4, hipe follicle of Columbine. 5. Fipe achrne of Ranunculus. 6, Numerous thele wided empels of Ramunculus. 7, Spurred petal of C lumbinc.
calya and corolla are not easily distimghishable, the terin Pretrth (1. v.), wr proveme, is umplovel, as in the lily, crocus, iris, and the errater number of ambgenous phats, althoush wen in these there are really two whorls chisely miterl. In some hawers, there are several whorls of leaves forming ane or each of the thorat envelopes: and in like mamer, some have several whorls of stamens, and sometimes thore are several vhorls of the carpels which form the pistil. in sume fowers, ecratan whonls are cotirely wanting; and thons not a few exogenoms plants are abstitute of the corma, which is sometimes the case with phants-exceptional "petrous species-very newly allied to others that have it. It is ly a similar abortion of a whorl that Howers become inisexual. Both stamens and pistils are enomally present in the sume Hower, wheh is callet a herauphroblete or pryitct dower ; but many flowers centain only the male organs of reproduction, ant many contain only the fomale organs, and such dhwers are described as unisecuen, Jhelinems ( q . v.), or inputyet: and respectively as mole or stamifio ons, anulimale or pistillifinuis llowers. Male flowers are atso called barmo or sterile and female flowers fortite althourl their fertility depomis on the commanication of pollen from the staminiferms diovers. When both male and female flowers are promed on une plant, the slecies is sand to be momoctous (fir., having one house): hat when they are on seprate plants, it is ducines (ir., having two houses) ; those which podnce mile, female, and hemaphrodite flowers are callel poly, monns: Sometinues lowh stanens and pistils are wanting, and the haver is then said to he neater or omply, as in the cane of the florets of the ray in many compresite Hhwors. Sometimes, on the contrary, both ealsx and combla are wanting, and then the flower is said to be nukd ar achlemizteous (Gis., withont covering), as thewers having only one thal envelope are called momochemytroms, ani thowers having looth calyx and combla are called tichlompleous. Aehnamydeons Howers are often gromped in some peenliar mimer, and protected hy braets or by a sjathe.

Flowers are always regular in their maneutal state-whorls of devatel points ur potilles; some vit these, however, are not unfrequently abortive, whilst more frequently, some acquire a grater revelop. ment than others of the same whorl, making the whon and the thower irregulur; :und preater varieties of form are common in the metanorphosed leaves which compose the flower, than in true leaves themselves. The internodes, or portions of the axis between the whorls, are sometimes also peeuliarly developed into /isc (q. v.), Gunophore (I., V), \&e. The ritturent whorls often differ in their Estication (1.v.). But a beautifil symmetry may generably be tracml in the arrangement of the parts of flowers, the whorls eonsisting of the same number of parts, and the parts of cach whorl being placed oppsite to the spaces of the whorl exterior to it ; amel this symmetrical plan of the flower remans manifost acon when there is abortion or extraminary develoment of particular parts. The mumber of parts in the pistil is, however, often smaller than in the exterior whorls: and sometimes jartionlar parts apmear to be divided, and so aprarently multiphed. as the long stamens of the Crucimon, cach pair of which is to be regarded as one stamen split into two, aud has its phace accordingly amone the parts of the flower. The symmetry of flowers may lw illustrated by the ionlowing diagrams:

Illostration of the Symuctry of Flowers (from Paliour's Bratrune):
a, Diagram fof the fower of lheath (Erica), hasing four sepatw,

Tha Hower in petrameroma, complete, sysmmetrical, ind reqular. $b$, Diagramatic saction of is synmetrical partameroun tlowre of stontrrop (Satum). concicsing oi fire sppals exturably, five peobis altrakting with the gepalw, tem sammens in tho rowa, and the carpele contalning sprobs. The linus on the ontate of the cargels are
 Iris There are thrte atormating divembans of each rhatl.

 which is partialis divided inso twn. It is [ensatuerous, complete, symmetricul, and regatar.

The develomment of dowers in innst cases fullows the complete formation of the stem-leares, more rarely precedes or acconpanins it. The matoline of the parts of a flower is cabled its flowering on blow soming, and when their functions are pertmoned, it fantus: the dhablemberpes, the stanems, and even the style, sometimes falline ofll carls, and some of them sonnetmus remaining in of withered state matil the ripeniur of the fruit ; the caly not unfremently amburuing such mostifications as to cuavert it into a part of the iruit itself.

In the greater number of plants, flowering takes pace, during the liowering season, intiseriminately, at all hours of the day; and the flowers onee
opened, remain preta, wen during night, till they fade. In many plants, huwever, as shep of fouer,s takes phace; they open and elone with the returns of day and nimht. Jhns, suntlomers open in the monins, and blyee at evomint; whilst there are wher llowers which onn in the evening, and close in the momint. Whass also opern anl elose at certain homs of the llay; thas the flowers of the common furshane pen athont 11 o'clock A. s., ant cluse soon after midday: Antherichm promeriliemem upens its flowers about "- p. M., anl closes them before night; the large fracrant blossoms of frofas Irambilurus open betweon 7 and 8 p.as.. and its shetb commentes soon after mitnight. In a few phats, the sleeping and waking of the dhwers are rurulatel by the comations of the weather. The wathing and sleepine of 样ers either continnes for several diys in sucession, as in some shecies of
 cnils when it tirst sleeps, as in the Tiger-flower.

The odours of fowers, extremely varous, wfon delightiml, and annetimes bery offensive, are in some cases equally powerful as long as the flower is "pen : in othror, they vary in strength at different tinnes of the day: Some thiwers, as those of Mrsharis tristis and $P$ clmoponium triste, althongh remamines onen during the dity, diffinse theiz frastance only When nieht comes in. The Oriental Hyacinth, so commenly cultivated in windows, is at all times lereputily frasrant, but tills the atmosphere of the ichartment with its perfume ahont eleven o'cloch at miunt.

The coloms of the different parts af flowers, the bariety and beanty of which remder many of them So attractive, gemerally remain urchanged, hat some. times umbergo chances thons the life of the tower. The thowers of Myowntis ermiculor-a small species of Furget-mo-but, sery common as a weed in garlensare suphurydow when they first open, and afterwards chanice to hace. The petals of 'heironthas: mutalitis, when they frost expami, are yollow, ani aiterwaris pass to orance. rent, and dinally purphe. In Ifylremefa hortensis, lamiliar as a wimtiow-plant, the flowers are at tirst areon, then rose-colour, purplish red intermixal with green, and finally, when :hume to fale, they are of a sickly reen. Smme thwers underge remarkille changes of colour turime the day, as thine of the common pink Plow. which. early in the moming, are lisht lilue, and beome lnight pink as the day alyances; and those of Ifinorus carcobitio. which are white in the moming. pink at num, aml hricht red at sunset.

The enlours and odours of thawers are suljicets in the investication of wheh physindogists have mot yot hacenable to an far. The chemical probucts on which they immeliat ly depench are partially linown: hat linw the ehmical changes are wrought, am what varions purpese they all serve as to the phant itsolf, can scarcely be sain to have even lug an to he asoutainel. both eolous and odours are mone or lass owing to the action of the sun's mas. Thry are also smetmes monitied ly soil; and diversitios of polme have heen ohtahod in cultivaton flowes by changing the sul in which they arow.

A few homme ar mible although none are of any importance ob this accomit. Some, of parts of them, are used in dy yinu: lant notwithetandine the heanty ambl variety if the colours of flowers, a very small promortion of wetable dye-stults is oltained from then : and a similar remark is applicable to their modicinal nse. Fin dyengry andinting, the colones of fluwers cans schtom the ebtained in considerable puantits. "xecpt at too ereat expense, ant seldom of brinianey at all correspanding with that which they exhibit in the Huwer itself. They are also in general

When the routs. whieh have often leemne matted rumad the outside of the hall of arth, are puncel, and the plant is ather restoral to the same 1ut or transferred to a larger one. The ehanse of surl male at this time is, aceordin's to eiremmstannes. cither complete or partial.
FLOWEELS, Aimmotal. This denant banch of manuacture, thoug not nsually ranked amone the tine arts, may be farly regarded as hohlins an intermadiate plice between them and the mechamieal arts. The ltalians were the first to bring it to a high state of perfection, and it is now suceessfully earried ont both in Lindandand Franee. The valne of artificial thewers ammally exportol from Fratec

The materials used are very varions. Fiations have long been used by the Sinth Aucrican Indians. In ltaly, the cocoons of silk-worms are dved. and extensively used. Beantiful imitations of tlowers are manle from shells, fither in their natural colours ar tintel. I'aper, riblons, velvet, thin hamine of whalehone, de., are alse bect. The materials of which the artifien thowers commonly in use are mate are l'rench cambric, Scoteh canhris, jaomet, and tine cahteo, besides moslin, erape, and waze for: purtioular flowers, and satin and velvet for thick petals, \&e Wix-hower-making is quite a distinet lorach, and those who fullow it chim vith justion the title of artist. It will be treated mater the hewl of Waxflowers.
The petals and sepals of the fowers, as well as the leares of the phat, are stamplout hy $\mathrm{l}^{\text {mon }}$ hes. or "irons, as they are techaially termed. A lare stotk of these irons is necessary, as speial fums and sizes are remuived for mach flower. The uroxt prexss in shaping is that of "guffering' or 'gatufler. 353
ins: la nane of whin the hallow form is given to futals, and the milrab, and vius of leaves imitated. Far lunlowing butals, the gofferingeirn is smply a fulished irom bail momuted on an irnn wir. in a lamelle. It is slightly warmed, and the 1.tal is flated on a cushint, and the iron presseal arainet it. A varicty of other forms of potlicring. irns ar" useal such as prismatio rons, hent wires, de. The remation of haves is effected ly dies minte ai iron ar copper, wheh are nerertheless callell wherime irons.
'The tinting of petals of the best dowers requires some amome of delicany and skill. In mature, luwner, the tint of each petal of a flower is rarely mifinur ; and the lest artifichal howers represent the matural variations with seat acouracy: The fotals of a rose for exampe are dyed by holding cach separatcly ly pineers, and then dipping it in a bath of camine and aiterwarls into pure water, to give delicacy of tint; but as the colour is usually detpest in the centre a little more dye is added there while the petal is still moist, ant this diffuses itsolf outwarels in liminishing intensity. The whiteness at the insertion of the $\mathrm{p}^{\text {retal }}$ is produced by touching that part with pure water after the rest is drad.

Leave are cut and stanmed in like mamer from wren talieta. cambric, calico. \&e. The glossy upper surfine is represented live contins the tallita, de., irmm whin they are stamped, with gum-arabic; and the soft tone of the under side is oltained by means of stareh coloured to the requisite shade, aind hrushed on when of the right eonsistenee to dry with the iroler effect. A velvety texture is Eiven loy dusting the powtered nap of cloth, which has laen provionsy dyen of the required colom, over the gromed leaf, the gum having lren allowed to partly dry till it has hecome 'tatey, The superthons protinn of map is then slaken ofl. Bubls are made of tafleta, tinted, and stiffemen, and stufted with eottm. Stamens are mank of short pieces of sewhers silk stiffened with gelatine. and when dry, the ents are moistened with -am, and diped in flum, chlurat yellow, to represent the pollen. Fine wire is sumetimes used for the flament of the stamen,

The thower is huilt up from the centre; the pistil and stamens are tied in a buneh to a piece of wire; the petals are arranged in orler. and pasted ; then the segms of the ealyx are pasted outside of these, aul further secured ly winding fine thread or silk rom the lower parts. Other wires are enelosed with this thread, and form the stalk, which is bound round with ercen tissue paper ; and at proper intervals the leaves are inserted by means of fine wires, to which they are bound, the ends of these wires being bound in and incorpmated with the stalk, and cuncealed by the grea latier.

Besines the flowns emped from nature there is at consid rable demand for what are called fancy thowers, most of which are iavented by the manufucture to use up, waste and spuiled fragments orimally designel for better purpeses.
lowers suitable for monning are prepared by conting leaves, Howers, de., with strong gum, and then dusting upon them powdered galena. This sulstance. a sulphuret of lozed, is formed naturally in lustrous culic crystals of a dark-gay eolour, and huw ver tincly it is powderel, the fragments still teme tor retain the same shape and surface, and thus prosint in nomber of flat glittering facets. It is used in like manmer for eheap jewellery.

FLOWERS, in Chemistry, is a term originally given ly the alchemists to the sublimates which wis, wr apwarel to frow from certain bodies capable of underging volatilisation when suljected to heat.

Thus, flowers of antimony. foncers of arsenic, flowers of benjomin or benvoin, flouers of sulphur, flomers of Ainc, \&c.

FLOX AERIS is a term applical to the suboxide or fal oxide of ermer.

## Flude. See C'moner:

Flfill. The mathematical refinition of a fluin is. that it is a collection of matmial porticless which cam be moved anmer each wther ly in imetimitely small force. No thid in nature strietly fultits this Ildimition, thond very many do so sufliciently nearly tor make the comelnsions fommale on the definitiom pratically correct. Flums are distiongasherd intor clastic and inclastic-the finmer beme thase the volume of which is rimining hy pressure, and incroses when pressure is rembed ; the latter being thase which have mat this property, e. .f., "atire and all those flaids termod Tiqnils (I. Y:). Elastic thuils are also spokn of as eomuressilna; and inelastic as incmmessilde-which, strintly speakins, no known thaid is, although all ordinary liquils are suthemently nearly so tor mathle us to regard them as such withnit manible enom, See Varobles, Elastater amd Thent, Comestor amb

FLUKE, the puinted triaghiar termination to eakh arm of :un Anchor (q. ऊ.).

FLUK゙心, or FLCKE-WORAI (Distome byaticomb, an contozom common in the liver and biliary dhets of ruminionts, particularly of shecp, in which it prodnces the discase called liup often cansing great montality in flocks during wet sensums anil no ill-drained lames. It receives it. common name from its risembance in form to the flomeder, of which thetee is a sicotch aml oh English name For at smilar reasom, it is sometimes calles Metice. It is a Trmantiole ( 4 . or.) wom, higher in organisation than the cestrich woms, lut not so high as the redrminthe. It is gron'rally not quite an inch in loneth, often math 1 ess, hat sometiones mone; of in wal form, it., hevalth alont half its lomatly;
 tom hepetican), from the liver in which it exists: it has mo eyes nor wher known organs of sperat sense; it is hemaphodite, and the mogns of reproduction wempy areat part of its holy, the ovaries being rangel alnge the margiu; its anterion extromity is fomishat with a sucker, and inother is situaterl at a small listance on the rentral surfare, whence the name Dislome (fir. twomonthel), lut the terminal sucker alone is perforated, and wose as a month, by which bile-the fowl of the ernature - is imbibel ; the tube which proceds from it mot, however, becoming a proper intestinal canal, hut som dividing into two large hamehes, amb ending in minute ramifications in all parts of the forely. Irodigions numbers of flukes are sometimes found in the liver of a single sheep, and of very different sizes, but they are now believel nut the maltiply there as was formerly surposen. Their ergs, indeed, are producel there in great quantity, but find their way inte the outer world to hegin a series of transformations not yet very aceme ately traced with resard to this particular specins, but of which the general nature is known. See Cebchen, Thembtode Womas, and Gemerition, Altinixitios of. It seems that the youns hukers, having entered as Cercarise into the budies of
mollnses or of aunatic moset larve, are ennveyd intes the stomand of mminants fording on herligns to which these are attached, ond linding their way to the liver, there attain thea full development, soce liow.

## rly Thap. see mane.

FLYMC, or filfillt, is the leecmotion of an animal in the air, hy nucas of wimen, mans specially alatent th that purbsic. Thy mems of these organs, the ammal raisis itedi from the sromed aut sustains itsclf in the aire as well as moves forward in any direction it haines. lirds and lats are the only "xistinf verturnat amimals pesssing the power

 Flying Drames, and whably eva the ereat fuco tural tims of Ilying Fithes, servius ouly to sustain them in the air affer the mamer of a parachute, or
 ohliphe ascent. The extinct repthes called l'terndactyles (14. w.) 1"suseel, bewever, the puwer of
 thes wis cs wero wentructul ma plina as different from than houth of hrikand of brits as these (sere bhes and biste) are from cach uther. The wings in all werteleate animals are the ant rior limbs, and are thats lumwnent to the arms of man and the fore-
 answering to thise of the hame are much albrecriated and consulilatent in bats, they are proligionsly Monsatel: in pto remactyls, there was melongation If is single finger. Ameny limes, although the power of thight is erneral. there are exceptious to the rule, the wius "of some leing mercly rudimentary, and at mot maly helpfal to them in ruming, thinse of inthers heing adapted to swimming, nut on the surface of. but unler: water.- The only iuvertelmate animals prsiessing the power of Hight are insects: to the greater part of which vastly mumer. mis class it luelongs in their perfect state, althmonh thure are also many imencts which are guite destitute of it, and this is sumetimes the case with yceins very clusely allied th others which possess it, nay. sumetines this great lifference exists letween the sexes of the same species. The wings of incects are mot at al! homberes to those of the flym
 strm ture are willy different from them all. See Isumers.
In Hying the wins are mande to leat or strike the air. 'The struke in the one direction, howeres, must be very differnt from that in the other, or rather from that movement ley which the wing is brought
lack to its place for another stroke. This difference is secured fartly ly yerater foree of muscular action, and conserpent rap idity; the resistance of the air varying as the sinare of the colonity with which the wing muses in giving the struks: But it is also securea partly be the confumation of the wins itself, the quill frathers uf birds lading so phaced that they strike the air with their ratest extent of surfare in the proper stroke of the wing, and uhtiguty ens it rifurns fo its juleres. An imitation of this is mate in the rewing of a luat, and is callen forlherim the
 axtendrel upen jointed lomess are panaldy in part Ghled up in mer to the retmo from arery stre ke: and thix is whaps the case also with the wines of some insects, althonefl thase of whers-as the C'mo mon Fly and the lee-are cortainly incapale of it: yet it is possible that even these may haw a crentir degree of rigility communicated tor them hy than inthation of their airetules during the strok than the y have during the return.

Flying is analoms to swimming ; lont the differ cnce of moclum is very erat, fresh water lwines ahont som tames heavior than air, and the donsity of sea-water still greater. The leolies of anmats intended for thight are therefore smotinus aldiptes] to it partly by memes whinh tend to diminish their
 msects; which, howerre, are still more impromt in relation to the increase of musenlar f"wer ; and it is chiefly by the increase of muscular buer that the power of flying is imparterl. The exercise of streneth remuisite for swimmine is compratively small, ahout $\frac{1}{6}$ oth prate only of that which is ropidsite for tlying. How womberful, then, the muscular farwer of hirds capable of lone-sustamed thight, far execeding in rapidity the speal of the switust lomotive ensine ever construted by man! of of insects, which in respect at least of rapinhty, is in some species not inferior to that of the swiftest hirds! The muscular power excreal in tlyin: evidently differs very much both among hivis and among insects. The large wings oi some rapuire also much less frequent muscular action, eithur to sustain the lomy in the air, to clevate it, ur to move it forward. than the conmaratively small wines uf others. The motion of the wing of hamane birels and of insects is ton mad for the eyn to follow.

It is nut to lee womberel at that projects of lenenmation throng the air have Jeen muh entertancal ley men. har that, whilst the force of the onjections already stated was unknown, artiticial winus, and an imitation of the lli ht of hirts, occuphed the ingemuity of inventors. (ircelan fible ascrilnes sucecss to the mythic bemahes (y. v.), who is said to have passed safely wer the fiemith on wimes which he himsulf ham male. More monlern stories of similar success, althourh in far shorter thichts, are mowerous, lat oftar desulve themstles, when envefully examined, into exasgerated scomants of feats performed on ropes, wings hawing been perhaps ampored to rember the "xhibition mare attractive perhals also to rember the wrinmane more easy by their extent of surfare and resistance to the air. (other instances are on record of persuns who, apparontly hy some parachute like eontrizanee, desomed oblictuely from high towers to a considerable dintanes; as, in the l:th or 14 th c., Elmoms, a monk, is said to have flown more than a furlong from the top of a tower in Spain, hut the distance is promably molh exagerated: and in the loth c., besnier, a locksmith of suble, in France, who prulently began from windows one story ligh, ventured at last and sately to leap from very elevated positions, amb so passed wer lowses or over rivers of consilerable brealth. All these, however, were mere feats destitute of
uthlity, althoug they encomagen the expertation of letter result, whicli was cherishod by som of the most seientitie mon of that priond. Dishr! Wilkins, in partieular, de soted mach attuntinn to this suliject. Perciving the inalequacy of the haman arm and the matedes which maso it to eive suthiciently rapmel motion to wings of sumbient sife, he suggests that - it were thanfore worth the daguiry fil comsinder
 ly the laknur of the foot, whith ario noturally mome
 sucers, that lee antiripated the thate whem it man
 as lee then diffor his loonts and his larse. Num recentle, in the emb of the 15 th and hegimine of the bith e., Nir Gorige layley mompiol himsels with speculations and experimente on this shiject. Acknobleging the dithenty which arises from the Wat of muscular stronsth in man, ha says: ']t is whly hecesary to have a tirst moser, which will wemerate more power in proportion to its weinlt, than the mimal system of museles.' lut this first muser has not hithorto laem foumh. The employment of stema fir this purpuse has been frequently phonsel. Attmpts of this kinul, howerer, have mather for their olject abial nasisation than artilicial flying. promerly so ealleal; althoush the insenthons have bon wrimaly desimatel amial shins, thyine machinse, \&e A quat difituity has brean fomm in the wight of the stern-engine :mal its facl; and cepriments which hive cost monsmall sums, and have exciten not a little of pablic attentim, have Abnally failen through misealemation on this uscmtral punt. FoCls. Certain $]^{m i n t s}$ in the ellipse, hy werman, and parabla are called foci. Sce Eillised, Hyrfa:pora, and Parabola. Focus, in Opties, is a Iuint in which sereral rays mect and are collected after loing retlected or refracted, while a rirtual foens is a peint from which rays tomd after reflection or refraction. The principal focus is the focus of paralld rays after reflection or refraction. See

FODDER (Ger. fuller, Anglo-Sax. foddor), the form collectet ly man for the use of the domestic herlivorens cuadrupents. In English, the term is commonly restrictel to dried herhage, as hay and straw: lint in other languages, it is more comprehonsive, and inchules all the food of cattle, except what they gather for themselves in the fielke.

The prinepal part of the fom of all the domestic borlinura is furnished ly grasses, almost all of which are maten by them when fresh and ircen. lesides the sumblies which they recoive of all the kinds of corn cultivatel for himan frool, they are also, to a comsiderable extent, depemilent on the strow ar drical harlage of the com-phants for their winter provender: and that of many other grasses, cultivatel on this accomnt alone, is convertel into hay for their use. Hay, being cut and rapidly drich whilst the flome is still fuil of sap, contains more mutritions mattir than the ripench straw of the cereals. The must important folder grass of Britain is live Grass, nuxt to which must he ranked Timotin Grass; but all the mealow grasses and larger pasture ?rmsen also contribute to the supply of hay.

Siext to the prasses must he ranked different kinds of Lorguminoser, atbording food for cattle in their seens-as hems, pease. lentils, hupines, \&e.and in their herlage, on acconnt of which many of them are coltivated, as chover, merlick, melilot, vetch, tare, sainfoin, \&e., of some of which there

## FODDER-FOTLS

are numerons spectics. Some of these also often enter pretty larely into the componsition of hay, heing cut and dried with the grasses aiong with which they have been sown: which is the case also with some plants of other orders, as the libwort Plantain, \&-: Some of the Cruciforer are cultivated to a considerable extent as furage-pants, cattle being fed on their erem herbase, althong they are nut suitalle for diving as fomber: Among these are kale and cabbage, rape, \&c.

In sume parts of the world, cattle are not unfregatatly fed on the leaves of trees, as in the Ifimalaya, where the leaves of different species of Arolia. Greteit, Elm, and Oak, are chiolly embloyed for this pmonse, and are collectod, dride, and stacked for winter fodider.
Foots, although not forler in the Fnglish sense, must here also be mentioned as constitnting a large part of the fool provided for cattle. particnlarly those of the potato turnip, manobld, and carrot, and to some extorat also thase of the parsuip and Jerusalem artichoke.

FODDER, in Law. It is gemerally consitured to be implicel in the rules of gool hobsandry that the hay and straw produced by the farm shall be consumed ou it. In Englam, ' in the absence of any agrement respecting the removal of hay and straw, the right to do so is regulated by the custom of the country.-Woodfall, 1. 535 . The custom differs not only in different eonnties, lut in difierent parts of the same eonnty. In the namower sense of fodler, in which it is used to simnify hay or straw that has been alredy usel for bedling cattle, or the like $p^{\text {morpose, there sems to be } 10 \text { ghestion that it }}$ must be retained on the firm. "Whatever question there maty be with respect to hay and straw, as before notieet, all the hitter, fuhler, dung, mannes. and compost, must invarially le consumed on the lants; incled, if this is not expressly provided for by the terms of the contract, it is always implied, as a removal wonld elearly be a breach of mood hus-bantry.'-Ib. Where the ontging tenant leaves fodder on the premises, he is cutitled to no compensation, except under an express stipulation. In Scotland, where the rules of good husbandry are more strictly attended to, the tenant must consume the whole of the forlder produced by his lands. except the hay and straw of his outpoing crop, and the same rule is applicalle tu assignees and subtenants. In some comties, felliler used for making lung is consideral steellow (1. v.), and given to the incoming tenant: lut this is usually regulated ly express stipulation in the lease. At one time," says Mr Hunter, "it was hell that a tenant had a right to dispose of the straw of the away-going erop. although the lease bore a general canse, binding him to consume the straw on the farm during the lease. But the mule now is, that where there is an express stipulation that all the manure, hay or straw, shall be used or left, it is strictly interpreted, without control from local usage; and the tenant is not entitled to take away or sell, or have vilue for the straw of the last or away-going crop.'-Landturd and T'nant, ii. 1. 461 .

FOETUS, the term appliol in Mediene to the manmalian embrro, especially in tos more adranced stages. In the human snbject, we usuatly speak of the embryo at and after the chd of the forirth month as a foetus.

There are several proints in relation to the foetus which are of great interest both to the physiologist anl to the medieal jurist. It is frequently of great importance in medico-legal inquiries to be able to ascertain the age of the foctus; and to facilitate such determination, the 1hysical characters which it
presents at differnt ages have bech careinlly noted and ineseribich.

In the futus of nime months-the full term-the length is from 17 to $2 l$ inches: weight irom it to ! 13., the averate being about G1 17 . Eiven at birth, the averate lensth and weinht of the male infant slightly exceeds that of the fennalp. From numerous olservations made loy Quctelet, it appars that there is an average excess of longth of 48 has, and of weight of twelse ounces, in the mate infant.
The average weight of infanto, without regaril to sex, was found by a French olserver, 'hatussier (whe noted the weight in more than 20,000 cirses) to le ahout 6.711 . - the maximum leing $11 \%$ ant the minimman 82 Hf . From the inquirics of In Joseph Clark (1hilosom hical Transaction, vol. 76), which were made on 60 males and 60 females, the average in this comentry seems rather higher, the weight of males being 7 Ill. 6 oz, and that of the fomalrs being nearly 6 ib. 12 oz ; and Professor simpson has arived at very manly the same result. Clark observes that if, at the full time, the weight of the infant is less than shla, it rarely thrives. Varions instances are rceorded of infants in which the weisht at lirth has excecied twice the average wejght. Thus a case is reeorded hy Mr Owen, in the Lunce for 1838, in which the child at delivery weinhed 1711. 120., and was 24 inches in lensth : aml in the Mediob-Chir. Lemer, Ontober 1841, there is the mention of a case in which the weight was nearly
ls lh. 15 lb.
There are certain points in which the fotus at the full rerine differs anatomically from the chide shortly after birth. The bony skeletom is very incumplete, cartilage occurring in the place of many bones. Inverl, complete ossitication (viz., of the reatelure) is not finished until about the 2oth war, and the only hones completely ossitied at firth are the minute ossiches of the car. The difference lnetween the foetus and the chide in this respect is, however, only one of decree.

During pregnanes, a temporary oran, termed the placenta ( 1 maland known as the after-bith, from its heing thrown off shortly after the birth of the chid), is dereloped on the immer wall of the tuterus (see $b$ in the figure). This organ is mainly composen of vessels, and there poceeds from it the structure known as the umbilical cord, $a$, in which lie the umbilieal vein, which convers arterial blood to the futus, and the two umbilical arteries, which retum the hloml to the placenta. This monilical corl convers these ressels to the umbiliens, or navel. Befure tracing the equrse of the blood through the foctus we must notice the chief anatumical peculiarities presented by the vascular or circulating system lefore birth.

1. In the heart, we find a commmication hetween the two auricle's ly means of an opening temen the foramen orale. $\xlongequal{\circ}$ In the arterial system, we have to notice first, the ductus anteriosus (see $r$. in the forere), which is a large communicating trunk between the pumonary artery ant the descemting aorta; and. secondly, the liranches given ofi by the internal iliae arteries, which gomiler the name of hypingastrie as long as they are within the boty of the fuetrs, and of umbilical when they cuter into the structure of the cond, are continned from the fotus to the placenta, to which they return the Hood which has circulated in the fietal system. 3. In the venous system there is a commumication between the umbilical vein and the inferiur vena cara, called the thetus renosus.

Pure blood is brought from the flacenta ly the umbilical vein, which passes through the umbilicus, and enters the liver, where it divides into several branches, $d, d$, which are distributed to that

That a double enronat meets in the ripht anribe wow tream, suiled hy the linkembsu valve passing thongh the formmen
wiale into the loft auricle, the other through the anriculo.ventricular opening into the right ventricke. :3. 'lhat the comporatively pure blood sent to the houl and arms, as contrasted with the impure hloud sont to the lower extremities, canses the relatively errater development of the former organs, and prepares them for the functions they are called u!ni to perform; the development of the legs at linth leing slight as comparcel with that of the head ur arms.

Alnost immediately after birth, the foramen orale lecomes closed by a membramous layer, and the rhutus arteriusus and ductus rcnosus degenerate into imperviums fibrous cords.

The longs, previonsly to the act of inspiration, sure dense and solid in strueture, and of a deepred eromor, and lie far baek in the chest. Their suecific nravity is greator than water, in which they for protions of them) consequently sink, whereas lungs, or prortions of lungs, that have respired, float in that and.

In the preceting remarks, we mentioned nine months as the full period of fortal existence. The period of gestation is, however, only constant hotween certain limits, and it is of the greatest importance in reference to questions of chastity and legitimacy to determine these limits.

The average duration of gestation in the human female is comprised lectween the isth and toth weelss after conception. It is comparatively seldom that the actual a late of eoneeption ean be fixed witla positive cortainty; but amongst the few cases of this kind on record, Rigby mentions one in which natural lalour eame on in 260 flays, and Reid mentions another in which it did not commenee until the lapse uf wos days. Jere, then, we have on unquestionable range of 33 davs; and many apprently anthentic eases are on record in whicli a longer jeriol of gestation than in Ieid's ease has heen ohserved.

Another important question in comnection with this snliject, is-What is the earliest perion at which a child can be bom, to enable it to live, and to continue in life after its hirth? There is no doubt that children horn at the seventio month of gestation are eapalile of living, althoudh they usually require muth care; and children may be born alive at any perionl between the sixth ancl scventh months, or even in some instances anlier than the sixth; but this is rare, and if born living, they commonly die soon after lifth. Varions cases of this niture are collected by Dr Taylor in his Medical Jurisprudence: amonust others, he mentions a case reported by Dr Barker of Dumaries, in which a chilit was born at the liSSth day of-cestration, and (thonch small) grew i]. In the celebrated Kinghorn ease, the chilel was born 174 days, or nearly six calentar months after marriage, and lived for more than eight months: aml the majority of the modical witnesses who gave evidence on that necasion were strongly in favour of the view that the perion of the grestation was riremmscrihed by the perion of wedlack.

Asain, questions connectel with prolonget rasta. tim have given rise to mueh disenssion in logal medicive. No period has heen dixed by liww bepond which a chnlel if born in wed]ock is to he declared illegitimate. In the case of Amberton $r$, (ibl)s, $183+$, the vice-chancellor decided that in chilal lom ten wonths or about forty-two weeks after intoreourse with the husband, was legitimate. In the Garchor J'errase ease, which came befure lise Ilouse of Lorels in $1 \mathrm{~s}_{2}^{2}$, the question was, whether a child hom 311 liays (or 44 weeks and :" days) aiter intercourse comble leritimate. Lord and Lady ( Gardner separated on the ;0th of Jimuary 1502, aml diel not again nucet till the 11 th of July: A full-sized child was

## FOG-FOG-SIGNALS

born of the Sth of Decernoer uf that yoar. The principal olstetrie practitioners in the linulnow were examinel on this point, and a lare majority eoncurred in the opimim that natural gestation miflit be protractorl to streh a period. The dueision, whel wats aranst the hogimatey, seems to how been mainly if ant entirely based on the monal eromals that lady Ciminer, after semaration from her latsbram, was living in open atultery. Lu the ease of Commonweath $\because$ Porter (see Aheriam Journal of Wadied ficienre, $18-\frac{1}{5}$ ), it was recently lecided in the Cnited states that a child hor:a :ilf days (or forty-tive weeks and two days) aiter eonemetion was leritimate. In the case of ('ontorall 8 . ("ntterall. decirleal in the Cimsistory Connt in Ihty, the Lusband had frocewded acianst his wife for a divore an the ground of alultery. In this sace. if it were the child of the lushani, it sut:st have buen form aiter twelve months" gestatius. Dr Lowshinetma, withont entering inte the question of protractoll Gestation, at one pronomacel for the divares, such id duration of prognancy not beners suppanterl i,y any known flets.
'This article would be imparect withoat a motion of the puestion- What constitutes live-firth? 'Ihis is a point on which the most histimonished alstetrie anthoritios have ditlural: some hohbing that where there is muscular movement, there is life: while oflers maintain that where mopiration has not been prow to thave taken place the chikd was still-horn. Aramust the most celeharted lawsuits bearing on this point, we may montion that of liels $\because$ l'almer, tried in 1806 , and that of Jronk $\%$ Kellinck, triell in $\mathbf{1 5 0 1}$. In the last-namact case it was decided ly the Vice-Chancellor, Sir .I. Stuart. that a child may live for some time after lirth, and not heathe, the absence of sigms on lowathory beine held to be no proof of its hemg born dead. It wats given in evilehee that there was pulation of the funis after seturation of the corsh, and the beatine of the heart was rearariled as prow of hire-birth. Hence we may regam it as now established in linglish law, that respuration is not rerpuiserl to establish live-birth. Nor do the kuss of juance or the United states require that the child shall have breather. In Scotland, the law requires not only that the child shall have brathed, but that it shall have eried ; and in conformity with this law, as chitd whieh hivel, breathed, and died in eonvalsions at the end of half an hour, was dechared to Lave lean horn dead (1)erers Roports, 25).

The last, his grandson, Gastom de Piox, was prolably the nost heroic momber of the family. son if - Jean du Foix, Comote d'Estamues, and Darie d'Orlans, sister of Lumis XII. of France, he was lom in 1459 , and in 1507 roceived from his uncle, the French kin:, the title of Due de Nemmors. In the Italian wars carried on by Louls, Gaston displayed the most briltiant and precorions genins. He twice overthrew the Swiss, at Como and Milan; chased Fope Julius II. from Bologna; suized Brescia out of the hands of the Senctians; aud, to crown a series of splendid triumphs, which ohtaned for him the title of the Thunderlole of Ituly, won the great lattle of Fiavema over the spanards, Ilth April 1512, in which, however, he fell, at the carly age of tweniy-three. On his death, the estates and title of the Huase of Foix went to Hemri, ling of Silvarr, whose daughter, Ieanne d'Albret, marriel Antrine de Bumbon, bue le Vembiome, and becane the muther of the grat Henri Guatre, who thas attached the county of foix to the French crown.
DU'LALAND, or FOHKLANXI, the land of the folk or perple in England in Anglosaxon times. The folclimat, acerding to Turner, was that portion of the linglion which was retained in behalf of the public, and with a view to increasime popmation and the growing wants of the commmity, and mot permitted to Decome allowial estate or absohte 1 rivate [moperty. Of this daml, the usufruct or domimime wile was fugosed by the frcemen, for which rertain ronts were paid to the state, and which din mot become hereditary: On the contrary, the rights which were loch in it by indivaluals revertel to the commonity at the expiry of a partienlar term, When it was again given out by the folcgemot or court of the district, cither in commonty or in sevcralty: Certan services to the publie were commonily imposed on the holders of folcland, such as the reparation of the royal vills and other public works ; the exercise of hospiatility to the king, and to other personages of distinction in their progresses through the country, by furnishing them and their messengers, huntsmen, houmls, hawks, and horses with food, and providing them, when necessary, with means of transport. It does not seem that the foleland was held exclusively by the common people, but rather that it was open to fremen
of all ranks amb combitions, and that the posses. sion of it was muln cosetell evon ley these who held grat estates 1 in the lerentitary title which

It was alsn frerumontly given tos the churelh, for the purperse of fomading momasterics and thap like. a practice of which Bede complains in lis oclelnated lettor to Arehhishop Eghert. - It is lisgraceful to say, fremons wha have mot the least clam to the monastic character; as you yourself lest know, have font so may of these spots intu their luwer, muler the name of monastories, that ther is really mow mo phee at all where the sons of nobles or voteram soldiers can receive a grant.'-Lemble's starmen, f. ©99. Kimblule gives axamples of the dows pail by momasteries for the follemm which they frell, which affurl eurions information as to the proklucts of industry and mondes of livine of thuse times. In ssis, a manastery is freed from all du"s which the monk were still bumat to foy to
 "xen, swine, and sheel. The ines of the monastery at 'Gantan werp-a feorm (or moteramment) of one night to the kinge aml right dous and one doy-keper : and nine nights' ked for the king's falemers, and cariven, with wagons and horses, for Whatever he would have taken to C'urry or Wilton; and if strangers came from other parts, they were to have guidance to the nearest royal vill upan their

FOLIVAR, a fown of Jungary, in the county of Tolna, is situater on the rest and slope uf it hill on the right lamk of the Damulse, fy miles south of P'esth. It has a Eioman Catholic hiuh selmol, is a stemm-brat station, has an important stmgen-fishery, and considerable trabe in wines and agrienltural probluce. T'op. II, 500.
FO'LIA MALAJA'TIRRI, i.e., Malabar Lenves, formerly in mod repute as a medicine; an ammatic tonic: "the dried leaves of "innamomen mitidum. and partly of ' ${ }^{\prime}$ Thmeth, speceies of cimanm, small Indian tries or shmets.
FOLIA'TION, a term restricted by Mr Darsin, and snlsempatly loy genlagistx, to the altumating layers or plates of diferent mineralngical nature, of which greiss and some other metanorphic sehists are composed. It differs from cloavage, which is applied to the divisional planes that remper a rock fissile, although it may rifunar the cye quite or nearly lomogenems ; and from lamination, which is the easy splittine of a rock into its urigimal layers of deposition. It is ditheult to determine the earse of folliation. Some hold that as gneiss is composed "f the disintegrated ingredients of srante, the layers are ilentical with the original lamina, having licen arraged according to their rarimes densities. Sut it can searcely be conceived that water womb low alde to deposit such materials in the same order orer areas so immense as those occupicil by enciss strata. It seems more $\mathrm{l}^{\text {noblahbe that the arrange- }}$ ment is owing to sume wilespreal metamorphic and segregating foree, which oncrated sulsequently to the depusition of the beds.

FOLI'NNO, a town of Contral Italy, in the province of Terupii, in the fratful valley of the Topino, is miles moth uf Spoluto. It wis formerly surrounded by walls, which, however, have becin

Sr: on tireside amusements, on superstitions and vilya arons. What may he valled a sulbescetion of bull lore has at the same time heen amply illus. trated in the Surser! Rlymes, edited by J. O. Hilliwell, and the l'onulier Ahemnes of scollanel, editerl hy linfurt Chambers, It is to be ahserved that, while fallk-Jore has thas leern engagine the attention of litepary men, and pit heyond risk of oblivion by talime its face in solid books, it is everywhere leclinane anome the people themselves. I'o this edfect, the diffusion if scientific iders, the disfivomr of the dergy for everything connected with the superatural except religion itself, and the great imlustrial changes and improvements of the last fifty suars, including a meatly increased shifting of the people from ofe district to another. have all conducal. In the British Islants, no etlort has been minle to pencralise dalk-lore for any purjose connected with anthropoloty, ethnolngy or any other scioned; lint in Germany, as is well known, the lamed brothers. Jacuh aml Willuelm Grimm, have turnad the abcient simple usages and traditions of the peasant's fireside to excellent aceoment in ilhustrating remote periods of the national history.

Folshate (a meeting or assembly of the 'folk' or people) was the term applicd ly the Suxoms to district meetings fenerally, thompl Kemble is of opinion that originally it was the great meoting of the nation, which was afterwarls convertal into the Witenagemote, or mecting of the comncillors or representatives of the nation (Kamblés sacons in E'mglund, ii. 1. 194).

FOI, Elwarl the Elder, is nearly syonynums with the common law, or rather with the rights which the common law eanfers on the people of England.

HOLKSTONE, a rising town of England on the south-a ast const if licut, is a municipal bormurh. seaport, and bathinoplace, and is situated $8 ; 3$ miles east-sonth-east of Jondon ly rail, ind five miles west-sonth-west of Dover, It stands on meven gronul at the fout of a ranee of hills. The oldest part lies in a narow valley, erossed by a manni. ticent railway viahet. It has rapilly extenied and inpmove since the opening of the Southeastern Railway, ame the establishment of steampackets from this town to Bonlogne, 30 miles to the sonth-east. Betwren the two places is a sthmarine chain of rocks only $\mathrm{l} t$ fathoms unier low water. Pop. (186i) s.52s. F. unites with Hytlie in retuming one member to parliament. In is60, 155in vessels, of 206,051 tons, entered and cleared the hartwor. The view from the pier extents from Shakspeare Clif: at Dover, to l'airlight Head, at Mastinus; the lbonlogue heights are also suen. In the vicinity are the remains of Roman intrencl. ments. Here IIarrey, the discoverer of the circulatiun of the bloot, was born. (1571-pop, 12,694.)

FOMENTA'IION (lat. fomentatio; also fotur, from foret, I hatlus) an application of warmth amel moisture to a part. ly means of eloths wrung out of loot water, somotimes modicated with regetable infusions of substances calculated to rolieve pain or stimnlate the surfice. Thus, opium, belladomm, chamomile, twrentine, de., are used in varions forms in commection with fomentations, which are of very great service in the treatment of almost all pinful local lisurilers.

FONBLANQUE, ALbisy, jommalist, born in 179\%, was intended for the bar, and became a puil of ('hitty, the eminent special pleader. Cistleronergs six Acts marle him it political writer. As

influence on public opinion between the years baptismal font, in its normal form, consists of 1526 and 1830 . Leigh Hunt, who was his pre- a basin or cup, nore or less eapacunus, hollowed decessor in the editorship of the Eraminer, says of lim in his Autoliography, 'He was the genuine successor not of me, bat of the Swifts anl Aldisons themselves; profuse of wit even leyond them, and superior in political knowlentge.' The characteristics of his political writings may be gathered from his work, entitled Englund under Seven Administrations (1533), which is simply a reprint of the more historical leading articles published in the Eicaminer from the period of the Caming and Goderich ministries, to the return of the Melhourne ministry. li's services to the Whigs were rewarted by his appointmont to the office of secretary to the Statisticul Department of the Poarl of Trade in 1.55\%. This pust, which he stall holds (1862), does not, it is understoon, interfere with his oceasional contributions to the jourmal with which his name has: heen so long associated. (Died 14the Oet. 1572.)

JON1 DU LAC is a name of varions application in that portion of the United States which originally belongeil to French Camala. I'rimarily denoting the inner extremity of any great boiy of fresh water, it has, seconlamly, beem made to indicate adjacent localitics of different kinds, chictly in connection with Lake Superior, the grand reservoir of the St Lawrence, and Lake Winnebago, which empities itself from the westwarl into Lake Nichigan.-1. The Fome du Lac of Lake Superior has lent its appellation to a village in Minnesota, situated at a distance of abont $\because 0$ miles, on its navigable tributary, the St Lonis- - The Fomd In Lac of Lake Winnelago designates both a county and town of Wisconsin. The latter has sprung up mainly since 1845 , has a pleasant situation on a wooded slope above the lake, an important trade in grain, provisions, and timber, a great mumber of Artesim wells, and a population in 1859 of about 8000 .

FO'NDI (anciently, Fundi), a small town of Italy, in the north-west of the province of Terra di Lavoro, is sitmated six miles from the coast, on the Appian Way, which now forms its principal strect, 56 miles north-west of Naples. it is an ill-lmilt, dirty, and miscrable town, in the neighinnmood of a pestiferous lake (the ancient Lacus F'umbumss); the surromming plain, however (the ancient Cucubus Aghr, which prohnced the famons Cecmban wine of classic times), is very fruitful. F. is surrounded in juat ly walls of eyclopean structure, and has a pophation of 5701 , who are said to be in the Inighest degree wihd and liwless.

FONSECA, a bay on the I'acitic coast of Central America, lies between the twor states San Salvador and Nicarasua. It claims notice principally as the proposed teminms of an interoceanic railway from the Puerto Caballos in Honduras. The intervening country has heen surveyed, and reported as fivourable.

FONT (Fons Baptiwnalis), the vessel used in charches as the repository of the hapismal water. In the early period, while inmertina contimued to be the ordinary rite of the administration of the sacrament of laptism, the laptistery (see baptisterim), or other place set apart for the ceremony, was furnished with a basin sulticiently capracious to admit of the administration of the rite aceording to the then prevaling form. lint when it beame eustomary to baytize by athosionthat is, by pouring the water on the beal of the ferson to be baptized-the size of the Lasin was naturally diminished, and eventually it assumed the dimensions and the form which are now faniliar to us in most of the medieval churches in Great Britain and upon the continent. The
out of a solid block, and supported upon a stem or perlestal. It is ordimarily of stome, but some ancient examples of laten fonts also ocem, and a few of copper or of bronza. In peneral, however, it may he sail that the font, in its extemal form and charater, followel the prevailing style of ecclesiastical architecture and ornamentation. From its connection with one of the most solemn rites of religion, it becanc very carly a favonite sulbject for the exercise of the slecorative skill of the artist, and there are still preserved in different churches fonts which exhilsit characteristics of each and all the snccessive fashions through which church arehitecture has passed since the intromuction of the font in its present form. There is somm dondet as to whether any existing specimen in England really belongs to the saxon period, but examples are fond of all the later styles, from the Early Norman down to the latest revival of (rothic architecture in our own day; the Early English, the Decorated, of which a beantiful example ocenrs in the charch of All Saints, Norwich; and the Perprodjeudar, which is scen in its highest perfection at Last Dercham in the same county of Nerfolk. The amexed engraving exhibits a highly eharacteristic

suecimen of the fonts of the beginning of the lith $\therefore$, which stands in the church if swatom, Lincolushire, erected alout 1310 .

The external figure of the hasin seems to lave been originally cirenlar or elliptical ; but most of the later fonts are hexagonal, or even ejeht-sined. The basin was comunnty supported on a single pillar or stom. Nany cases, however, oceur in which it rests on three, four, or five pillars, or, as in the engraving, on at group of pillars or pilasters united uto a solid stem. The exterior, as well of the lasin as of the pertustal, was oftom hingly docorated, ordinarily with sculpture, hat occasiomally also in gold amt colours; the designs on the basin commonly repesentins subjects connected with baptism, or its types aim symbols. We frequently meet aromal the fedestal figures of the apostles, sometimes only deven in number, Judas being omitted.
In the Foman Catholic Church, the service of Easter Saturlay contains a solemn form for the blessing of the baptismal font. After a long series of prayers, and amil a very imposing ceremonial, the 'chrism,' or consecrated oil blessed by the bishop, and also the socalled 'oil of catechumens,' aro

His Curves fompletes haw been republished scveral times. "Ihe most complete edition is that pmblished at Paris (: 5 vols. 18IS).

FONTENOY, a village of belyium, in the provivee of llainatut, 5 miles suth-west of Tournay,
with a prpmation uf almat son, heserves mention as the secene of the liattle of limatenoy, one of the most famons montests in the war of the Austrian Snecession. The lattle was foucht 11th May 17.5. the drasine forers beine the Fronch, fobow strong, moter Marshat Naxe ant the allies (Enylish, Duteh, and Anstrians), in nearly erual foree, under the Juke of ('umberlaml. Siter it hard fought fight, the allies were furcerl to retrent. The lass on both sides was stated at about form mon.
FONTEYRAULT (Foms Ehraldi), a small town of France, in the departmont of Mancect-Lrime, is miles south-east of sammur, with a forpulation of alont 830 , wes its origin tos a wealthy amd celebrated abley, now convertell into a prisin for then departments. This ablocy was fumbed loy diubert ilArhoissel, a lireton monk, in 1090, as the rusilenee of is monastic snciety composid of renitents of luth sexes. This sneicty twok the name of the Trder of Fomternult. It followed the austere rule of benedict, bat had this peenliarity, that the monks were muld ly an abbess. and but by an ahont. The order of form somed thrmyh France, and into Spmon, and in the fomer country esperially aequirch groat riches. The ahnesses of J . lohomged, for the most part, to illustrions fanilios, and were subject only to, the popes. At a liter periml, the strictaess of the manatic disciplime was relaxed in favour of the muns, whence, howerer, in the 1 Ith c , sprung great disonders. (Hadually, the arime of F. full into disrespect, but aven at the outbreak of the French lievolution it passessed 57 priories in Irance, which, however, were then abolished along with the other monasteries. The tonn is of reculiar interest to Englishmon, from the fact that it contams the censetery of several of the l'lantarenet lines of England and of the comats of Anjum. Of these, however, only the tumlis of Henry Il., of his queen Eleanar of Guieme, of C'cur-de-Lion, and of Isabelle, the queen of John, have bern pre served. The bhe monastic builitings ami courtyarls, sumbunled by walls, and curoring from forty to fitty acres, mow form one of the laser prisums of F"ramce, in which about 2000 conviots of both sixes are contined, and kept at inlustrial occupations. sice an accomst of this prisem in (Whembersis Litinburghe tompul, 이 series, wh. i. p. 10.t.

## FOOD AN゙D DRINK.

Furnge for liming chimays. to protect the aljacent wouldurk from dire. Its whots are a font or more in lengh, and brumbed: they that in the water. The irnit is "If the sides of the stems or hranthes.
 Whmentary substanes are known to chemists, unly a comparatively smanl momber of these take part in the furmation of man and other amals: and it is omly this small number of comstituents which are wsental elements of our food. These dements are carlum, hydrogen, nitrogen, axysen, phowhoms, sulphur, churiue, sodimm, putassiun, calcium, mat nesinm, iron, and thorine.

Carlam, lyalrogen, jutroned, amb oxyeren are sumpled to the system by the alhuminoms gronp of alimentary prinefos (sce loer) viz. alhamen, fihrime, ant cascin". which aceur lath in the animal and resetalule kingloms and the gluten contained in vegetables. Animal thesh, ws, milk, corn, and many uther vegetable products, contain one or more uf these primeiples. The delatinous group also introdue's the same clements into the system, when such sulstance as prphrations. of isidglass, calves' iect. \&c., are taken as foom. Carbon, hydrogen, and oxysen are ahmantly introduced inte the system in the form of sugar, stareh (which neeurs in large fumtity in the cereal grains, leguminous seeds. ront:, tubers, \&c., used as food), and organic acils (which. as citric, malie, tartarie acil. \&e., oceur in numerous veretables employed as fool). Carbon with a little hydrogen and oxygen oceurs abmendantly in the oleaginous gronp of alinentary principles, as, forinstance, in all the fat, suct, butter, and oil that we eat ; in the oily seeds, as nuts, walmuts, cocoa-nuts, \&e. : and in fatty foods, as liver, brain, \&c. Phosphorus is supplied to us by the thesh, hood, and bones used as food (the tlesh of fishes is especially rich in $p^{\text {hosphoric matter), and in the form of }}$ varions phosphates, it is a constituent of many of the regetables nsed as food. The system derives its sulphur from the fibrine of tlesh, the albumen of ergis, ami the caseine of milk, from the vegetable tibrine of corm, \&e., from the vegetable albumen of turnijs, caulitowers, a paragns, ke, and from the vegetable caseme of prase and beans. Nost of the culinary regetables contam it, especially the ('ruciferce. Chlorine and solium, io the form of chloride uf sodium, are more or less abundantly contained in all varicties of animal foot, and are taken separately as common salt. Fiotassium is a constituent of hoth anmal and veretable foul: it ocurs in considerable quantity in milk, and in the juice that permeates animal thesh; aml most inland plants contain it. We derive the calciun of our system from tlesh, bones, uggs, milk, \&e. (all of which contain salts of lime): must regetables also contain lime-salts; and another sourci of vor calcium is eommon water, which nsually contains both hicarbonate and sulphate of lame Hagnesinm in small quantity is generally foum in those foods that contain calcinm. Iron is a constitneat of the blool found in meat; and it vecurs in smaller quautity in milk, in the yoke of esge, and in trates in mont vergetable fools. Fhorine vecurs in mimute quantity in the bones and teeth. This small quatity is aceomed for is the traces of thombe foum ly Dr deorge Wilsum in mills, hunl, \&e

These simple bolles are not however, caphate of bing assimilated and consorted into tissue: they mast he prevolsty combined, and this combination
 'ilhe mantior of comhimel elements varies: thas watercontains only two: surar, starch, fat, and many "reanic auds, contain three caseine contains tive; and fibrine ahe albomen contain six.

It would be impussible, and it is quite mmecessary, to muntion in this artick the different animals and plants that are used as food by different mations. The suligect is however, an interesting one, ambl thense who wish to study it may le referred to Moleschott's Physiologie der Nuhrungemittel, IS50, and especially to Reche's Fiderangs- und Gemessmitpethonde ( 15600 - 1861 ), which is the most learned and daborate work on the subject in any language.
besoss are merdy liquid fonds. They all pertain t, the aqueons group noticed in the article Diet. They are arranged ly P'ereira in his Treutise on Food (end Hite in the six following orders:

1. Mucilaginous, farinaceons, or saceharine drinks -as toast-water, harley water, gruch, \&e. They are very slightly nutritive, and diffor but little from common water.
2. Aromatic or astringent drinks-as tea, coffce, chorchate, aud cocoa. The action of the first two is nuticed in the article 1)ier. The last two drinks contain a considerable quantity of oil and starch.
3. Acidulous drinks-as lemonale, ginger-lveer, raspbery-vinegar water, \&c. They allay thirst both hy the acid which they contain and the water, and form cooling antiscorbutic drinks.
4. Drinks containines gelatine and osmazome-the brotbs and soupls. These, if properly prepared, should contain all the soluble constitucnts of their ingredients.
5. Emulsive or milky drinks-as animal milk, the milk of the cocoa-nut, and almond milk, a drink prepared from sweet almonds. Animal mill coutains all the essential ingredients of food; the others are slightly nutritive.
6. Aleoholic and ather intoxicating drinksincluding malt liguor or beer in its various forms of ale, stout, amp porter; wines; spirits in their various forms of brandy, rum, gin, whisky, \&e.
'Consillered dietetically,' siays 1'ereira, 'heer possesses a threcfold property : it quenches thirst; it stimnlates, cheers, and, if tiken in suflicient quantity, intoxicates; and lastly, it nourishes or strengthens. The power of appeasing thirst depends on the aqueous ingredient which it contains, assisted somewhat ly its acidulous constituents (carlonic and acetic acill) ; its stimulating, clecring, or intoxicating jower is derived cither wholly or principally from the alcolol which it contains (from 2 to $: 3$ per cent.) : lastly. its mutritive or strengthening quality is derived from the sugar, dextrine, and similar substances contained in it: moreover, the bitter principle of bops confers on heer tonic properties. From these combined qualities, beer proves a refreshing and salubrions drink (if taken in moderation), and an agreeable and valuable stimulus and support to those who have to undergo much bodily fatigue.'

Wine is our most valuable restorative when the powers of the buly and mind have been overtaxal; but as the most perfect bealth is compatible with total abstinence from it, no possilite henefit can accrue to a bealthy person from commencing its nse. The uses of wine as a tonic during convalescence after lingering diseases, and of either wine or spirits in some aente diseases (fevers, \&c.), are too Well known to require notice.

Tha aetion of spirituous drinks lais been noticed in the article Diet, and will be further disenssed in the article Temperaxce.

We shall conclude this part of the subject with a word or two on the condiments or seasoning arents which are taken with foods for the purpose of improvine their thavonr. Excluding salt, which must le considered as a saline alimentary principde, the most common condiments, such as mustard,

## FOOD AND DRINK.

eapsicum (Cayenne pepper), pepper, the various spices, \&e., owe their action to the presence of a volatile oil. Siances are usually thid mixtures of these condiments with alimentary substances. In a bealthy state, condiments and sances afford little or no nutrition; and although for a time they may stimulate a debilitated stomach to increased action, their continual use never fails to induce a subsequent increased weakness of that organ. Salt and vinegar are the only exceptions. When used in moleration, they assist in digestion; vinegar, hy rendering muscnlar fibre more thail; and both tugether, hy producing, as Dr Beammont believes, a innil baving some amary to the gastric jnice (Experiments and Observations on the Costric Juice ant the Physiology of Digestion, 1. 40, 15lin. 183S).

The cookery of foods, althongh lartially noticed in the articles Bolling, Broiling, Coolefry, Diet, \&e., requires some general consideration in the present place.

All foods possessing an organisal structure, as animal flesh and amylaceous sulstances, recuire to be cooked before being eaten, the only exceptions being the oyster and some ripe fruts. The processes of salting, pickling, and smoking havlen the amimal textures, and, as we shall luresently sue (at all events in the case of salting), induce chomical changes which render the meat less nutritions.

The ordinary operations of cookery are hoiting, roasting, broiling, baking, and frying.

In the case of vegetables, iriling effects the solution of gummy and saccharine matters, the rupture and partial solution of starch grains, the coagulation of alluminous liquids, and the more or less complete expulsion of volatile oil. In the boiting of hesb, there takes place a more or less prefect separation of the soluble from the insoluble constitnents, according to the duation of the boiling, the amount of water employed, and its temperature at the commencument of the oleration. If we wish the builed meat to contain the largest amonnt of nourishing matter, and disregarl the sonp or bruth that is simultancously formeal, we introduce it into the boiler when the water is in a state of lrisk ebullition. We keep up this hoiling for a few momutes, in order to coagulate the albumen near the surface, and thus to convert it into a crust or shell, which equally prevents the entrance of water into the interior, and the escape of the juice and soluble constituents of the Hesh into the water. If coll water is then ulded, so as to reluce the temperature to ahout $160^{\circ}$, and this temperature is kept up, for the necessary time-for which, in refernce to the weight of the meat, see the article Pomingall the conditions are, according to Lichig umited which give to the flesk the quality lest adapited to its use as forml.

If, on the "ther lami, we wish to whain grood smu from meat, we should place it in cold water, and hring this rovy erveductly to the boiling-point. The interchange between the juices of the flesh and the external water, which was presentel by the furmer process, here takes place withont hindrance. -The soluble and sapid constituents of the tlesh are dissulvel in the water, and the water penetrates intu the interior of the mass, which it extracts more or less completely: The llesh loses, while the soup, grains, in sapid matters ; and by the separation of allumen, which is eommonly removed ly skimming, as it rises to the surface of the water, when congulated, the meat loses its tenderness, and becomes tough and hard; and if eaten without the soup, it not "nly loses much of its nutritive properties, lut also of its direstibility'-Liebig's Researches on the Chemistry of Food, p. 12 s.

Roasting is applice much more to meat than
to regetables. Foth in roasting and broiling meat, the first aplication of beat sbould be considerable and rapil, so as to form an outer coating of coagnlated albunen (just as in builing), which retains the nutritive matters within the cooked meat. In roasted meat, nothines is remored but some of the superticial fat and the grayy, which is itself an article of foon. The effect of rossting on such vegetables as apples and potatoes is to render them more nutritive and digestible than they would be in the raw state, hy splitting their stareb grains, and rendering them more soluble.

Baking (1. $\because$.) acts in the same manner as rons:ing but meat thas cookel is less wbolesome, in ennsequeace of its being more impregnated with emprymatic oil.

Frying is the most objectionalile of all kinds of cookery: In this operation, beat is usually aiplied by the intermedimo of boiling fat or vil. Various products of the decomposition of the fat are set frec, which are very obnoxions to the stomacbs of invalids.

Lielig has shewn that saltel meat is, in so far as mutrition is concerned, in much the same state as meat from which gool soup has iseen male. After Hesh has been rulibed and sprinkled with dry salt, a brine is formed amounting in lulk to one-thied of the thid contamed in the raw hesh. This lirine is found to contain a large quantity of albumen, soluble phosphates, lactic acid, potash, creatine, amp creatinine-sulstances whicb are essential to the constitution of the flesh, which therefore loses in nutritive value in proportion to their abstraction.
The preservation of food reguires some notice. Three methols-viz., preservation ly coll, preservation ly the exclusion of air, and preservation by salting-are naticel in the article Avisintucs. The first is only of comparatively limited application: the second, known as Aprert's ruethoul, bas been successfully user in the English nary for many years; the cbief oljection to it is its explense: the thirl method injures, as we have alrealy seen, the cbaracter of the meat, and renders it lowth deticient in nutritive materials, and actually injurinns if it forms a principal and contimons article of dict. To these methods we must add preservation hy smoking, preservation with sugar, and with vinegar, and preservation ly drying. It is well known that meat suspended in smoke loses its tendency to putrefy, the substance from which the smoke derives its antiseptic property being ereasote or some allied lunly: Sonoked meat acyuires a peculiar taste, a dark colour, and a somewhat hard consistence: but it retains all its nutritive constituents, and is thus preferable to salted meat. Sugar and vinegar are chiefly employed in the preservation of vegetaide molucts. Tbe most important anole of preserving irticles of fool, whether animal or regetahle, is ly direct drying. Meat is cut up into small slices ahout a quarter of an inch thick, and regetables into smaller lieces; they are steamed at a ligh tomberature, so as to coagulate the allmmen; and they are then completely desicented by exposure to a current of very hot dry air. At the conclusim of the process, the slices of meat are guite harl, and present a shrivelled appearance. Ir Marcet ( 0 ) the Composition of Fiunt, 1S56, 1. ITx) suaks in high terms of this method, which he has limselt seen in operation in Paris.' 'Food thens meservenl,' he says, 'whether it be animal or vegetahle, has the alvantage ( 1 ) of remaining in a fresh condition, though freely exposed to the atmosthere for a great number of years, and (2) of being reduced to one-fifth of its original bulk from its having lost all its water.' He adds, that the prescrad vegetables rusume their bulk when

 and aliseovered that perisomous metal more or less abmatantly in all of them: "in throe, in a very eonsiderable quantity ; in one in highly deteterions amonnt : and in two, in perisonous amount.' l'ressurved fruits and vergetables (espectally gooseberries, rhabarl, premgares, amd olives) are often also contaminated larcly with eopper. In these eases, the corpuer, if in ennsideralle quantity, may be easily retected by painig a piece of pulished iron or stect in the suspected liguid for 24 hours, to which we previonsly ahd a fow arops af nitric acid. The eoprer will he depositend on the iron. Or ammonia maty be alded to the flaid in which the pickles or irnit were lyina, when, if comper is present, a blate tint is dereloped. We shonh be suspicious of all phekles, olises, preserved goosherries, de., with a particularly bright grech tint.

Wilk is usually Gelieved to he liablo to numerous adulterations, such as flome, ehalk, mashat hrains, de. It anpears, however, from lre Hassall's researches on Jumbon milk, that, as a general rule, water is the omly alulteration. 'I'he results of the examinations of 2 simples were, that 12 war gemmine, and that 14 were adulterated, the athlteration consisting prinerpally in the adelition of water, the percentases of which raried from 10 to 20 per exnt., of onc-half water. In the article Mink We slall deseribe the means of testing the purity of this tluid.

If space permitted, wo might extend the list of alimentary substances lialbet to adulteration to a much qreater length. In conchision, we may remark, that, as a preneral rule, adulterations of an urgmic nature, such as flours and starehes of varions linds, wre hest detected by the mieroscope; while chmical :analysis is usually neerssiry for the detection of mineral adulterations. In Hassall's Aldultmitons Disectal is a perteet cyclognedia on this suliject.

## FOOL. SEe ('OCRT-FOOL.

FOOLS, FExs of. The Jomans kejt the festival of saturn, in December, as a time of general licence amd reselry. Dming the brief season of the waturnalia (q. ъ), the slave reclined on lois master's seat at tallle, the master waital apon liss slave, and suciety, fur the moment, semed to be turned urside down. The grotesque mastquate survised the braran cred which gave it birth, and not only kept. it : place amonig the (hristians, lut, in the face of sulemun anathemas of fathers and commeils, found its way into the ecremonial of the Chrintian Chareh. It was eabled, at diforent times and places, ly many difloment mancs, lut las latterly come to be lust lanwn as the Fuast of Fools (Hestum Fatuorum, P'astams slaltortume).

The ciremmstane of the obscruace were thonost infinitely varied, but it was everywhere marked by

## FOOLS PARSLEY-FOOT.

the same spirit of broal, boisterous drollery, and coarse but not ill-matured caricature. The donkey played such a fropuent part in the pageant that it was often called the least of A sees (Fistum Asinorame). In some places, the ass of Jialaam was figured; in "thers, the ass which stom beside the manger in which the infant sariour was laid; elsewhere, the ass on which the Virgin and Chill fled to Egylt, or the ass on which Jesus romle into Jerusalem. In every instance, there was more ow Ioss attemit at dranatic representation, the theatre being generally the chief church of the place, and the words and action of the drama loing often ordered ly its book of eeremonies, Several rituals of this snit are still preservel. That which was in use at deanvais, in France, has a ruluric ordering the priest when he dismises the congregation to bray three times, and orlaring the perple to hray three times in answer, As the ass was leal towards the altar, h1, was greeted with a lymm of mine stanzak, of which the first runs thtis:

Orientis partilme,
dermatavit Asinus.
Pulcher et furtissimus,
sarcinis aptissimas.
ME", vere Alut, hé!
[From the reginens of the lastBlessings on the bomy least!(Game the Donkey, stont and strong, With our packs to pace alons.

Brat, Sir Dowhey, Bron!']
Whare the ass did not come uron the stage, the chief point of the faree lay in the clection of a moek fope, patriarch, cardinal. archbishol, hishop, or abloot. These mimic dinnitaries took such titles as ' lope of Fools,' 'Archibishop, of Dolts,' '(ardinal of Xumskulls,' ' Boy, Sishop,' ' Patriareh of Suts,' 'Albut of Conreason,' aml the like. On the day of their election, they ofter torck possession of the churches, and even necasiomally travestied the performance of the church's highest othce, the mass, in the church's holiest place, the altar. In some ennvents, the nuns disguised themselves in men's clothes, chanted moek services, anl elected a 'little ahbess, who for that day took the phace of the real abluess.
The Fenst of Fools maintaned itself in many laces till the Ieformation in the 16 th century. At Antibes, in the sonth of France, it survived till the vear IG4l, when we have it described ly an eyewitness in a letter to the johilosopher Gassendi. "lhe scene was, as manal, a church; amt the acturs, dressing themselves in priusts' rubes turned insile ont, read prayers from hooks turnell upide down, thonsh spectacles of rampe-pel, usimg coal or Hom for incense, amil a bilhiment of emfonsed cries, and the mimic lowhwings of cattle, aud grmeting of pista
The history of the Fiast of Fools has heen treated in suveral warks: the host is the Memoire pour servir a llinstuire de lo Fíte da Fous, loy Du Tilliot, phblished at Lamsanne in 1541; reprinteitat Paris in 17.5, and again in the horetil dos formones if ('outumes Retigioness do Tous las P'euthes, tome viii. 1, the astragalus, its upper articular surface; 2, its anterior ceiremits, which articulates with (4) the seaphoid bone; : the us ealcss, or ber-bone; 4 , the seaphoin bone; $b$, the inturnal cuneiform lone; $G$, the midale cuneiform hone; $\therefore$ the external cunciform bone; 8 , the cuboid bone: 9 , the nintatirsal bumes of the firt and secund loes; 10, 11, the fase :and secmal phalanges of the great toe; 12, 13, 14, the frat, second, and third phalanges of the second toe.
of the fuot, ami of the culnid lene externally. Thore are five metatarsal bomes passing forwarl, one for wh the. Euch cuneiform bone is connected with On, anul the culoin lone witl two, of these meta. tarsal bones. Behind, they are close together, liut as they run forwarls, they diverge slightly from one anther, and their anterior ends rest mpon the grument, and form the lurlls of the toes. They constitute the furcequart of the instep. The remaining lungs are thrse of the thes, and are named the Phutrmyrs, each toe laving three of these bonss. excepting the great tue, which hass mly two. (A similar liw hokls fur the lones of the hand, each finger having three fhalanners, but the thumb only tw..)
Tha instep is composel of the seven tarsal and tho fise met tatarsal hones, which are so arranged and comectell (sce tife. "') as to furm an arel from the "Stremity" of the luel-bmene to the balls of the thes. This is called the phantar arch, from plemete, the shl of the foot. The astrugalus fimms the sumuit or keystone of this arch, and tranemits the wight which it receives 1 nsterimly to the herl, ambanterindy to the halls of the tows. This figme ":habits the arrangrant of the tibres and laniuse in the interiur of the benes, amb shews that the Fowiter munk of them, in cach lone, follow the directions of the two pillars of the arch, and thes pive the greatest strength to the boues in the directinns in which it is nost reguricel.

The lwnes, where they articulate with one another, are cosered with a tulerably thick layer of highly chavtic cartilase, and ly this means, together with the very slight movements of which each hone is

Fig. 2.* $^{*}$
This figure represents a sectim through the lower end of the Labia, aml through the astragalus 1 , the her hone $f$, the saphond lone E, the internal cunciform bone, and the bonce of the great toe; A represents the phantar ligament, and 13 the interner caleaneo-scaphoil liganamt passing from the herebone, F , to the scaphuil, E ; Cis ane of two wmall honm cathen scsimond bines, usnally fimmen at the ball of the preat toe. The lines shew the dispusition of the damina or phates of which the sarious bones are composed. Tbe dear linc along the contiguons diges of the bones represents the carthage.
capahle, a degree of elasticity is given to the foot, auch consumently to the step, which would be alto. gether wanting if the plantar areh were composed of one single mass of bone. This elasticity is far greater in the anterion pillar of the arch, which is compend of five comparatively long bones sloping gralually to the ground, than in the posterior pillar, which is shont, narraw, and composed of a single lome, which descends almost vertically from the ankle to the ground. INence, in jumping from a height, wo always endenvour to alight upon the halls of the toes, and thas break the shock which we should fecl if, by accident, we descended upon the heels.

A reference to any staudarl work on anatomy (sce, for example, 'ray's Anutomy, pr. 178-154) will show that the ligments, which unite these boues to whe anotier, and by which the morements of each bunc upon the others are limiterl, are sery numerons. We shall merely motice two of these litaments, selecting thuse whose action is especi:llly. olvions in mantaining the shape of the plantar arch. One, the plentai lifamint (A, fig. 2), of grent stringth, passes from the umler surfice of the heel-hone, near its extremity, forwarls to the ends of the metatarsal henes, accorling to Dr llumphry (The IIuman Foot ant the Humatn Hand, 1861, 1. 25). Most anatomists do mit trace it quite so far forwarls. 'In other words' (we 'uote from br IIum, hry's volume), 'it extends between the lowest points of the two pillars of the arch, girding or holding them in their places, and freventing their bicing thrust asunder when pressure is made un'on the key-lune (D), just as the "tic-heam" of a rouf resists the tendency to outwand yielding of the sines when weight is laid upon the summit. The liganent, lowerer, las an advantage which no tieleam can ever possess, inasmuch as a quantity of muscular filores are attached alome the limbler part of its my per surface. These instantly responel to any demand that is made upon them, hing thrown into, contraction directly the frot tomeles the ground; anil the force of their contraction is proportionate

* This, and several of the followilus diagrams, have becn enfind, with 1r Humplry's jernission, from The Humun Fivt and the Human Hend.

## FOOT.

to the degree of pressure which is made thon the fors. In addition to its office of binding the lones in their places, the ligament serves the further $]^{\text {mippose }}$ of fristecting from pressure the tender structures -the flomi-vessels, nerves, and museles-that lie alnve it in the hollow of the foot. Another very strong ligament ( $B$, in the figure) passes from the under and fore part of the heel-bone ( $\mathrm{F}^{*}$ ) to the under parts of the seaphoid bone (E). It umderlies and supports the round head of the astragalus, and hats to hear a great deal of the weight which is tranmitteal to that bone from the leg. It possessun a utality which the ligament just leseribed, anl most liganents have not-riz., elasticity. This is very important, for it allows the head of the keybone (D) to descend a little, when pressure is made uron it, an forees it up again when the pressure is removel, and so gives very material assistance to the other provisions for preventine jars, and for giviug ease and elasticity to the step. op. cil., 11! $25, \mathbf{2} 6$.
The spot over which the ligament I; extemis is the weakest in the foot, the astracalus bring there unsuphorted hy any bones; additional support is, however, atfordet when it is most required ly the tendon of a strong muscle, the posterim libuel (ify. : 3 . D), which passes from the back of the tibia (the Thief brone of the leg) round the inner ankle, to be inserted into the lower part of the inner surface of the seaphain lone. It not unfrequently haplens that the astragalus, being either insufficiently supfurtel, or from its being orerweighted, descemls slighty below its proper level, causing a lowering of the arch, and a flattening of the sole of the fimit. 'The defeet, when slight, is known as 'weak ankle;' when more decided, it is temed 'flatfout;' and in extreme cases, the hone may desceml to such an extent as even to render the inner side of the foot convex, when it naturally should he concave.

The deformity of which we are sleaking is of such great practical importanee, that we shall add a few words about its most eommon canses.

There are two periods of life at whel flut:foot is especially liable to oceur: 1st, in infancy, if the child be put uron its feet lecfore the bones and ligaments-equecially the latter-are strong enough th hear its weight; and ?dly, about the age of fourtern-a periot at which srowth is very quiek, and the loody consequently attains a considurable and rapher armentation of weght. If young persons of this age are obliged to be a great deal on their feet, and ferhaps adtlitionally to earry weights (as, for example, butchers' and hakers' boys, and young nursemails), the chances that flat-foot will iccur are inereased.

We now come to the movements of the fort upon the les. We see here a striking emmbination of varicty of movement with gencral security. This combination is effectel by the harmonons aetion of three joints, cach of which acts in is clirection dillerent from the others.

The tirst of these joints is the ankle-joint, which is formed hy the bones of the leg-the tibia and fibma-alowe, and the astragalus leluw. By this joint, the forot is bent or straightened on the leg. The seemul joint is hetween the astragalus and the lucd-ione, aud it permits the foot to be rolled inwarls or outwarls; while the third joint is between the dirst and second row of tarsal lones -namely, between the astragalus and heel-bone behind, aml the seaphoid and cuboid bones in front, ant allows the degree of curvature of the phantar arch to be increased or diminished within ecrtain limits. The fullowing is the order in which the movements of these three joints occur: the raising
of the leel (hy the first joint) is accompanied by a rolling of the foot inwards (by the second joint), and by an increased flemue of the plantar arch (by the third joint) ; and the raising of the toes is aecompanied by a rolling of the fort outwards and a struightening of the sole. See Inumphry, op . cit., p. 42.
The joints, howerer, murely allow of movements; they do not effect them: this is the special function of the moscles; anl each of the three movements

Fig. :
This figure represents some of the museles and tendons seen on the inner side of the leg and foot.

## Foor'prints. Sce lemologr.

FOOT-ROT amongst sheep is of two rarieties, tho commoner consisting of an inordinate grewth if hom, which, at the toe, or round the margin, lownes turnel down, eracked, or torn, and thens atforels loxdment fire sand and dirt. Tnsufficient Wearing of the hoof is the obsions canse, and henee the prevaluge of foot-rot in soft rich pastures, amd cepecially anomst sheep previnasly aceustmed to bare rough, or upland walks, where the hoof is natamily worn down by the greater amont of walking neessary t" pocmre sustenance. Taken in time, when lamencso is first apparent, and before the hoof is crackele and the foot inflamed, a chro rapielly follows the carefnl paring of the superfloms and diseased hoof; inkeel, further treatment is searecly mecessary, moless any of the vasenlar parts have been lat have, when a little tar may be applind as a mill astringent and potection from thes. When, from inattention or neglect, the hoof is separated from the sensitive parts beneath, when mbers appar on the sole, or prombeflesh spurigs ur, active astringents or mid causties are necessiry. The shepherd's old favourite butter of antimony, diluted with an equal quantity of tincture of myrih, is a good remedy when cantiously ami temperately used. A convenient paste, which in inexperienced hands is safer than a fluid caustic, may he made with equal weights of Howers of sulphur and finely fowdered sulphate of copper rubbed up to the needful consisteney with lard or whl. Nany lave great faith in a mixture of the salt of eopler with gnneowler and lard.-The scoml and mure troublesome variety is allied to What is termed foul in the foot; instem of commencing at the gronnd surfact, it legins in the interdigital space, appears to depend umon constitutional rather than local causes, and frequently acenrs along with the oftlee variety, int, unlike it, actasionally becomes contagions. The foot is hot, tember, and swelled around and immediately above the curonct. There are mlecrations in the interdigital space, and the swelling, and sulisequently the prouting of prond-flesh, canse a separation of the tows. When the temelerness and heat are great, Poulties are alvisahle; but in the milder cases and earliner stages, the jarts shond be well washed with a solution containing to the pint of water half an ounce each of sulpharic acid and oil of turpentine.

When uleers inpear, they must be tonehed with lunar canstic, or dressed wath the laste already recommendel.

FORAGE (from Fr. fourage, a contraction of the lombarous Latin fodderagium, taken in its turn from the Gothic fo-dur, fodder), hay, straw, and oats supplied to horses of officers and solutiers in the army. Where troops are together, the provision of forage devolves on the commissariat: oflicers of the staff, \&e., who are entitled to horses, but whose duties are at stations where bodies of horse are not collected, receive a money allowance, in lien of forage in kind, varying acearding to the place and price of provender, but usually a mout 1s. 10 d , to 2 s . per horse per day. When a soldier is en route away from his regiment, the innkeper with whom he stops is bund, moder the Mutiny Act, to provide his lorse with the specified ration of forage-viz., 10 llss. oats, 12 lbs. hay, and 8 llss. straw, fur the payment of Is. Od. a day, which must also include stabling.

FOLANIN1'PERA, a group of marine animals of very low organisation, consisting of a gelatinoms substance enclosed in a shell, which is generally calcareous, cither simple or divided into chambers variously armated, and pierced with pores or lassages (forcmimu, whence the name), through which long delicate processes of the soft atomal are protruded, but for what parpose is not very well known, whether to seize fool, to imbibe nutritive fluid, for lowomotion, or for all these purpases. Nust of the splecies are minute, although on of unre thian two inches in diameter has been fomm in borneo, and fossil forms alproaching to this size are well kuown under the mame of Nummalites (q.v.), from their resemblance to coins. The existing species are very numerous, and have leen distributed into many genera. They are foumd among sea-sand, and among all the dredgings of

decp water. The fossil species are still more muncrons, and comstitnte great part of some calcuroous rocis, as of chalk. The F. are of very beantiful forms. Some of the simple ones are orlicular, some curiously flask-shaped; those in which the animal is diviled into serments, and the shell conserumety chambered, sometimes liave the segments arrangeil in a straicht linc, sonetimes spirally, sometimes
alternately, \&c. The great resemblance of some of the convoluted chambered shells of the F. to the shells of the genus Noutilus, led Linnæons and many naturalists to rank them with that genus, and the F. were reckoned among the most highly ormanised molluses, a place from which comparatively recent discoveries have completely removed them. They are now regarded as more nearly related tos Songe's and to such animals as the Proteas or Anata. "The Formminifera are evidently composite falurics crolved loy a phoess uf continuous gemmation, cach semmar remaining in comuction with the bosly by which it was put forth, and accorling to the phan on which this gemmation takes place will he the configuration of the shell, - liymer Jones. Feproduction takes place by the detachment of minute pramules in great numbers, and is alparently acempanied with the death of the parent. Se l'manom.

Fussil Forominifera. The earliest records uf this order yet olserved are in sandstones near st Peterslurg, belonging to the Lenwer silurian measures. Scattered throngh these sandstomes are numerous green grains, which have been shewn by Lhernbery to contain, in their interior, silicions casts of shells similiar to the recent genera Giuttolime and Tertulerio. Forns, apmarently referrible to the last genus and to Fusulina, constitute a large pertion of some heds of carbonifernas limestrice in liussia, and also in the United States. Among the secondary rocks, and especially in the Chalk, formmifera are very almondant. Chalk, indeed, is composen almost entirely of the perfect or hroken shells of Rotalia, Spimhline, Toutaleria, \&c. (see ('manis). They are not more numerum in the Tertiary strata, but here they attain an emormons size-gigantic compared with any that preeded them, ir with recent forms. Vast hels of limestone neenr on the borders of the Meditermanan, comjused ahmost entirely of these large forms. See Semmelifes and Nemmelite Limistuse.
FORBES, Duncan, of Cudboren, a colchrated Seottish prolitieim of the 1Sth e., and Lond I'resident of the Court of Session, was born either at Culloden or at Bunchrew-for the fimily pussessul both estates-in the neighbourhonl of Inverness, on the loth November lisis. In 170., the year that his father died. F., then a lan of 19 , commenced his legal stadies in Edimburoth; lont the following year he removed to Leyden, then the great sehool for Scottish lawyers of revolution principles, where he studied for two years with the greatest diligence. In auldition to the lnowleage of the civil law, which was no donlt the principal ohjeet of his residence at Leyden, we are told that he mate ronsiderable progress in Hebrew and several wher Oriental languages. On his return from Leyden, l'. was ealled to the bar, and almost immediately after apminted sheriff of Midlothian-a 1 romotion the rapulity of which is smewhat inconsistent with modern usages. He rose ralidly into practice and into political influence throngh his connection with the Great Duke of Aryyle, then in the zenith of his power, to whom he was mited by family ties, and of whose estates he acted as it sort of manager. Ite married Nary liose, the laughter if the Laird of Kilrarock, a woman of leaty and accomplishment, to whom he is said to have heen devotedly attaehed. She died shortly after their marriage, leaving him an only son, John, who eventually succeeded to his estate, but did mot inherit his abilities. During both of the rebellions, Duacan F. acted a prominent part on the side of the Hanoverian government. In $17!\overline{5}$, he was in the north, actively engaged in opposing the rebets, along with his eller brother John, who i.s said to have expended $£ 3000$ on the royal cause,

There is a heatiful pertratit of the Lord I'residlent $F$ ', who was a man of great legance of person and manarr, in the Parliament llunse in Eilmburgh. Thas most reecont and comMate hiograply of Furloes is that of Mr larton in his lives of Simon Lond Laviat and Dunean loorbes, 184.

FuRblos, Euw ifid, an cmiment maturalist, was lorm at Jonglas, Isle of Man, Febrabry le, 1S15, amot dial in Edialmorsh, Nownhber 1s, 1S.54. 1Te recoived a desultory and imperfect colucation in early life, in consequence of fll health: lout when he left home at the age of 16 , he had already possessed himself of a viry considerable amount of linuwledere in the departnents of botany, zoology, and genlogy. In lsisi, F. went to london, witl the intention of lecomine a student at the Royal Aeademy; but althomgh he winced much realiness in drawing, his artistic talents were not smbeiently marked to hold wat any prospect of suewess in the event of his makiner art his profession ; and he there. fore determinel to turn his attention to medicine, and, with this riow, entered the university of Ellinburnh. In 1836, he tinally relinquished his sperial melical studies, to devote himself "xelusively to the matman sciences. In $1503-150 \%$, he attewed leothres at loaris, where he stmdial under Geotiroy St Jilaire, Jussien, and De liainville, while he at the same time arailed himself with diliquee of all the advantages aftoried to stulents by the muscums and libraries of laris. From the first year of his coblece life, F. hal spent his summer vacations in rambles over various parts of (ireat Britain, or in excursions on the continent, amd the results of the olservatinns which he mabe durine these toms, which were published hy him either in the form of selarate works, "r in the pages of current seientifie journals, suthiciently attest lis diligence as an olsorver, and his exact apureciation of analories and liflerences of fomms. F. may amost be resareled as the originator of the mse of the dredge, which ho cmployed with equal suceess in investigating the marime foma of mur own seas, and of the Mediter. ranean and the Fgean. In 1841 , he joined the surveying ship Beacom, as naturalist, and aecompaniel that ressel during the survep of a part of Asia Ninou, and co-operated in the explomation of many of the Canthian cities. On his return to bingand in 1543, he fomm that lo had, durine his alosence, been elected to the cham of lootany, Linges College, Jondon. He was soon afterwards named earator uf the (reolowieal Society ; am from that period till his remosal to Edinhurgh, he remained in London, living in a vortex of serintific labomrs and literary work. In 1544, he was appointed palacontologist to the Musenm of Gealogy in connection with the Ordnance Geological Survey; and in 1S.31, on the "puints of the new buidings in Jermy"n Strect, Lomelon, he was named professor of natural history in the Shehoel of Mines. In 185:, he was chosen president of the Geologieal 太rebety; an homour never before conferred on so young a man; and in 1S53,

## Folubs.

on the death of Proffesor Jamoson, he was elected to the vaeant chair of Natual History in the univer. sity of Elinburgh. In the summer of 1s54, he deliyeren a short conarse of lectures - the only one he was elestined to give-for at the commencment of the winter sessim he was seized with a sebere illness, whicle speetily proved fatal, and terminated his life in the :30th year of his awe in the rery zenith of his fame, and in the full virour of his intellectual pwwers. F. had been a volumimons writur and a diligent observer of mature from lis earliest youth, ani lian collecter an immense mass of materials. many of which were, however. left at his death in a disorganised comdition. He lid mmelito adrance amd $8 y$ stmatise special departments of natural history, liath by his man lahours and ly the stimulus which he imparted to his associates and pupils a amb it would be diflicult to instance any nitharalist whon has exercised as greater influence on the thourht and line of inquiry mursued ly those who have cultivated the same branches of knowledge. Ilis classiffet tion of the British Sturifishes anmed as mew erat in that brathel of zoology: and his disonvery that air-hreathing molloses lived at the prine of the Purbeck beds, has been the means of rectifying many ermenus hyjutheses, and throwing mexpectel light on several hitherto obscure $j^{\text {wints }}$ of grology, Whate the infurenees whieh lee drew from the fresence of those animals have been fully corro. lmrated. His Revort on the Dgean Sea, aun his observations of the tertiaries of Cos, which have proved of great vatue tugeology, raised him to the: thghest rank amony living naturalists. From an early perimal, he hat directel his attention to the distribution of animal and recetable life ins ofifferent zones of the sea and land, and his whservations in this path of inquiry have nomed many new fiedes of research. F. was a diligent contributur to the current scientific literature of the day, and many of his liest papers were written fin the mectings of the British Association, of which he was an active member, and for the various sopieties with which he was comnerted; while her also twok a most rolicient share in the lahomes of the Orlnance survey huring his ommection with its staff. His segarate works, bapers, and monoGraplis, of which upwarls of 2 eno are publishend, and many of which are copiously illustrated by his own beantiful dmwines, cannot be individually Specifiel ; bot armony them we may instanet: thio following: in the Distril) of I'utmonit: Mollusert

 in Gerinany and the T!mol (15.ib). His last puossional work, wititled Nature and for in the ' 'are y! Hisutisfs (18.5), contains a systematic exposition of his madical upinions and cloctrines.

FOl:BES MAClELEZIE ACT. Tine statnte, popilady known ly the name of the untioman OAr Forbes Mackenzie, M. P' for Jechlesshire) who intronluced the lifl, is the 16 and 17 viet. e. 17.7 , entitlal 'An Act for the better Legrulation of Publie IIouses in Sontiant.' This act rotaincol in mentral the provisions of ? (3eo. IV. e, 5s, by whicls the erantiner of entificates hy justices of the prace imal magistrates, anthorainer persons to krep common inns, the-houses, aud viethallingJonses in ciontamb wins regnlated. but it prom fibntert the granting of certaticates for excisable lipuors to be 'lirunk on the premises,' maless on the express condition that no sroceries or other provisions ta be consmment elsewhere should be sald in the lonse or premises with respeect to which such eertificate is yranted. The oliject of this prortion of the ennetment beiner to meront eromers from becoming in reality the keepers of tiphlines-houser, those ]ursons continned to be permatted to sell liguors ley retail, provideal that they were not "onsunted in their shops. In accordance with the principlo of distingushing between the ditherent chassas of lanuses in which the trate of a spirit-alealer shond be caried on, three dilferent aribles of licences were intruduced: thuse allilicable, viz.,

 the lirst elass, it is enamed that they shall wot - bowp "pen homse, or permit or sulfer any drombane in any fart if the fromises leyonging theretos, or sell wi give wht therefom any lifuors before eight viclock in the mosning, or aiter eleven odelek at minht of any divy, with the exception of roiresh-
 the sabl homse of fremises; and inuther, that they shall not opsen their homses for the sale of any lanuors, "r sell or give mut the sinne on sumday, except for the acommonation of boblers and bome fiche travillers.' 'The same restrictions are imposed on the second class of persons-viz., the keeprers of pulile-hnuses, wath this aldition, that no exception is makle in thar ease in firvour of travellers or loderers ; whilst grocers and prosision-dealers, in mhation to the prohihition to open on Sumblas, and that alrady mentiomed with referene to the consumption of spirits on the premises, are forbinden "to sell or rive out any lipuers before six o'elack in the morning, ur after eleven obluek at night.' Soparate licences were also intrombed for the salo of ualt lingors from thase appliciable to the sale of wise and spirits, all of which had formerly been incluled under one lieence. By this statute, aiso, for the first time in sicotlam, the very formithibls power was conferres on the police of entering att buy time any phblic-honse, or honse where refreshments are sum to be consmmed on the premises, ant penalties were aramed aranast those who refused to adnuit then. or who oustructed their entrance. 'lhese frovisions having given rise to moth disenssion, a layal (ommission to inguire into the working of the wet was issurd an the 25 ah April 1509 . The result of the commasson was the issue, as usual, of two enormons columas of phinted evilence, and of a rejmert, nore distandislued for its lenesth than for the valuo if the surecestuns which it coutains. The fommissomers moved at the comelusion, that 'altlough intempreance still prevails to a lamentable extent, it would seem that this vee has been for some time uradually deseemding in the seade of soedety, ami that it is now ehnetly combined to the lowest class of the ["P]nlation'. 'Whis enfeet the eommissioners asoribe to several canses, of which the first and liost important is the ineroase of the cluty on excisable lifuors from 2. $43 /$ jer imperial gallon, at wheh it clood in $152 \%$, to So, to which it was dinally raised in 18.s.s. Nom do they dony to the Foubes Mackenxie Aet its share of merit. "The heneliemel chect of the act," they say, "is proved by the evolence which we received as to the dimination of crime, and the ehange fur the better in the habits of the people, immerliztely after the passing of the aet, when its provisions were strictly enforead, allal by the tenslency in an orposite direction which in sonse places has followed its less rigorous enforeanuent thring the last two years. In some towns, there has beon, on the pat of the magistintes, reat romiss ness in aulministering the liw. The result seams to have locen, if not an increase of erime in these plaes, at least the absence of the improverment watnessed dsewhere.' Whalst thas penerally apmoninf of the act, the commissioners sumgest a number uf alterations, mostly with the view of enabling the folice to earry out its jrowisious with greater elficioney. In reference to the ditioculty experienced by botel-kenpers in ascertining what persons came nudur the deseriptions of bond-fide triuvellers, the commissioners recommend that in future 'fersoms inducing hot-l-kcepers to sell or give ont excisablo lifuors to then on Sumas, by falsely representing thounclves as trabullers, should be guilty of an otlence, and be liable, on conviction, to a tine.' In
these eircumstances, it liecomes important to know that it has leem deciled in Englad that to constitute a 'traveller' within the meaning of the corresponding Act 15 and 19 Vict. e. IIS, s. 2 , it is a matter of indifference whether the parties be travelling for business or pleasure, and that a walk, ride, or live. for exercise and ammsement of such leneth as to renier refreshments ulesianthe, is a suffi-
 44?), C'hief instice Cockburn remarked, that 'a man condel not lee satil to he a traveller who erees to a place merely for the purpose of takine refreshment. But if ha gres to an inu for refreslumnt in the eumese of a jurney, whether of haneses or of pheaslare, he is entitleri to temand refreshment, amil the innkeeper is justified in supplying it." See also
 The tirat was in the case of a drive from Livertoml of $5!$ miles, the seconl of a walk from binmingham of 4 miles.

FORBI'DDEN FRUIT, a name fancifully given to the frat of different species of c'itrus. In the shops of Britain, it is a small variety of the Shadelock ( (I. צ.) whith generally receives this natne: But on the continent of E.urope, a different fruit, regarded by some as a varicty of the orange, and by some as a distinct species (C'iltus T'uradisi), is known as the forbiden l'ruit, or Adam's Aprle. Like some other fruits of the same genus, it was recently intronlucer into the south of Enrope from Chinal The tree has broml, taperins, and pointed leaves, the leaf-stalks winged; the fruit is large, soneWhat pear-shapecl, greenish yellow, af very uneven surfice, having aromb its hase a circle of deeper depressions, not milike the marks of teeth. to wheh it probably owes its name. It is chietly the rimb which is the edible part; the rimd is very thick, tember, melting, and pleasant; there is very little pulp; the pulp is aciul.
The name Forbidden Fruit has also been given to the frnit of Tubermemontona dichotomu, a tree of Ceylon, of the natural order Apocynacere. The shaipe of the fruit-which is a follicle, containing $p^{n 11} 1$-suggests the illea of a piece having been hitten off, and the legend runs that it was gool lefore Eve ate of jt, ajthough it has been poisonous ever since.

TORCE; E'八ERGY. Till we know what Matter ( $\mathrm{m} . \mathrm{v}$.$) is, if there be matter, in the orlinary sense if$ the word, at all, we cannot hope to have any idea of the alsolute nature of force. Any sleculations on the suhject could only laad ths into a train of hypotheses entirely metaphysical, since utterly bryond the prosent piners of experimental science. If we content curstlves with a cletinition of force based on experience, such a detinition will say nothing of its nature, but will confine itself to the effeets which are sail to lie due to force, and in the prosent state of our knowledge it is almost preposterons to aim at more.
Our tirst illeas uf force are evidently derived from the cxertion required to rall, or lift, hend, or compress, \&e., some mass of matter; and it is easy to see that in all such cases where muscular contraction is employed, matter is moved, or tends to move. Foree, then, we may say generally, is any catose whuch produces, or tends to proluce, achenge in a body's state of rat or motion. See Motion, Lalls of. The amomit or magnitude of a force may be measured in one of two ways: 1. By the pressure it can produce, or the weight it can support; ?. By the amoment of motion it ean produce in a given time. These are called respectively the Statical aud Dynamical measures of force. The latter is, as it stands, somewhat ambignous. What shall we take as the
quantity of motion prosheel? Ihas it mepend morely on the relonity pminced? or dows it take acemunt of the amount of matior to, whieh that vemoty is given? Again, is it porntional to the velongty itself, or to its square? This lant ghestion was wery tieredy
 lamin, the Bermonilhs. \&e. ; Leeihonts heine, as usual with him in ghysical questions, on the wrons site. Newton, to whom we cise the thal law an monas. band lasu before given the true measure of a force il. terms of the motion prodiceel. 'This law is an experimental result-that when pressure promuens motion, the momentum produced (see Monessers) is promtimal to the pressure, and can lee made (mumerically) equal to it ly emphying preprer units. Hence momentum is the true ilymanial measure of frree, which, therefore, is promintional to the first prower only of the velocity probuced. What is properly meistreal in terms of the spuare of the velucity: we shall presently see. For varions preperties of foree, statical and dynamieal, see the followin: articles: Compurimos ue Forees, colfoss, Centaris
 Mechanach Powers, Vimeal Vemoctres.

It is uhvious that in order to promece any effect at all, or to dowome, as it is technically called, a force must produce motion, i.e, must move its prent of application. A weght lake on a table produces no effect whatever maless the tahle yielits to the pressure, i.e., muless the weight inseends, bin it erer so little. We do no work, however much we may fatigue ourselves, if we try to lift a ton from the tluer ; if it be a hundredweipht onfy, we may lift it a few feet, and then we shall have fhate whin-and it is evilent that the latter may be monsum as so many wouds raised so many feet-introrlucin's, a new muit, the Foot-pocid. which is of weat importance, as we shall shortly see, in momern physics. Sce Work. This is evilently, however, a statical measure of work, since tro aecoment is taken of velocity. Have we then for work, as we had for furce, a dymumical mensure? Let us take a simple case, where the mathomatical inves. tigation is comparatively very easy, and we slall tind we have. We know (sce Venuctry ; Motor, LAws of) that if a particle be moving along a line (straight or not), and the distance musel (io the time i) along the line from the pint where its motion commenced be called $s$, its relucity is $v=\frac{d . s}{d t}$. Also we know that the force acting on it (in the direction of its motimn) is to be measured ly the incratse of tomentum in a given thme-this gives (just as the last equation was obtained) $\mathrm{F}=m \frac{d v}{d t}$. From these two equations, we have, immediately, mede $=\mathrm{F}$ (ls, or, as the rudiments of the differential calculus give at once, $\frac{m r^{2}}{2}=j \mathrm{~F} d s=\mathrm{F} . \mathrm{s}$ if the force le mifinm.
The quantity on the right-hand sile is the sum of the products of each valne of F , live com responeling space ds, throurle which the particle moved moder its action. It is therefore the whole work done ly the force. On the left haud, we lind half the proluct of the mass, ant the square of the velocity it has acquirch ; in other words, the Vis-iva (9.5.). Hence, in this case, the vis-viva aequired equals the amount of work expended by the force.
It appears from a general demonstration (founded on the experimental laws of motion, and therefore true, if they are), but which is not suited to the present work, that if, in any system of hoties, each be made up of particles or atoms, and if the forets these mutually exert be in the line joining each

 cetrantions uf the peetiles wh ecth wher

What ts spent, athe in mot, is stomed up in vis.

 pawer. If we eall the fonmet, is is ment merally
 may exporo the alowe las satim, that in :my notem

 beme alule to descent, it lat in common lamgage,
 the surface, and then dropurd, it is casy to sue that the work expended in rawing it will be exaetly recourpolas vis-visal after ita fall. For (see FadeIn: lonses) a mass falhg throngh a space, $h$, to the earth actuires a whelty $z$, such that $z^{2}=24 / h$, Ir if on the the mats, ber $\because$ $=$ mols. The left-hand side gives the vis-vina acopuired by the fall the rinht is the pronuct of the weight (my) ame the hewht fallen throws on is the work reatured to che \%ate the mass to its minimal altitule.
Honce we may calculate the ammont of work Which ean he whitancel trom a heoll of water in firwing water wheds, de. remembering. hawere that thate is always in thin (as it is usually called)
 is a los in uscful mower, is true but we shall tind presently that in emergy there is mone, as imbled for gencral result has already shewn. Hohere the aplarcitly lont cuproy goes, is another question.
Another rend example of potential nemery is that of the wights in an ordinary eliock. It is the gradual "meresion of potental into actual energy in the drivins weight which maintains the motion of the clock, in spite of friction, resistance of the air, 点: : and we have in the actual energy of somed (which is motion) a consilarable fortion of the -xpmbed potential chorgy of the striking weinht. A coiled watch-aping, a drawn bow, the charged roction of an air-gun, are gnnd examples of stures of futential merge, which cam be directly used for mechanical parpases.

The chenical arrangement of the different comfoments of sumpowile, or pun-cotom. is such as conresparads to, emomens potmial energy, which a Fonde spark converts into the equivalent retive amomet. liut here, hout has a considerable share in the aflects promed; it may then he as well, before proceding further, to misider how we can take swonnt of it, and other physical foress, as torms uib acres.
 know, the $1^{\text {bhencical }}$ forces may be thos chassitied :

 Fonsl; V1. Virul Fwate, having, as some most irratimally suphers, an andogue in inomanie masses. Whinh maty be valled ('rystathe Fores (This idea is deaminell further un.) (ff these, I., il., and some
 nenelor than the others that is in sase, that the
 existente of sume medimm unlike ordmary matter, or,
in perpular languas, an impemeroulde. The allumst mabrisul opmand if physicists, however, sterms to bo: that ewen the former must he accomated for in rumbe such way. Nioutun, in his secomel letter to fonter, says. with rempect to gravitation (and it is mbuns that smalar lamuage is apmicable to babecular forms eucrally): " You sometimes speak of savity as essential amd inherent to matter. I'ray, dar but ancribe that muthon tu me, for the "allise of pravity is what 1 do mot pretend to know.' And anain in the thind letter: "lt is ineonceivalbe thast inminate brute matter should, witherat the modistion of sommething cloc, which is not material, oluate an, and athere "ther matter withont mutual comant, as it mast du, if gravitation, in the sense of Epicarus, le essential and inherent in it; and this is ane reasm why I desired you would not ascribe innate gravity to me. That gravity should br imate, inharnt, and essential to matter, so that our furly may at unn another at a distance through a encuen, without the mediation of anything clse, by, and through which their action and forct may he conseyed from whe to another, is to me so grat an absurdity, that I believe no man wh" has in philosophical matters a competent faculty of thinking, ean ever fall into it. Gravity must lie cansed by an agent acting constantly acording to certain laws; But whether this agent lo. matirial or immaterial, 1 have Jeft to the consilleration of my readers.' Of what that medium may consist, we cannot, of comrse, hazard even a eanjecture: lint if it be companed of seprate atoms
i. ce, not contimus-it is evident that a secomel medtam will be recpured to help the particles of the first to act on each other for withont this, the first medinm wonld be merely onstructive), and so on. This must stop, smowhere: why not, then, at the first? Fut in the present state of our knowlelge of mechanics, a continnoms malimm is barely conceivalle, aml its motions, \&e., present considerable ditticulties to eren plausible mathematical trentment. If we take the viow olpused to Newton's, as Mosotii and others have done (their ideas are considered further (on), we can, in a very artilicial manner, lowerer, account for srasitation anel molecular action: lint, as lefore said, the foundations of this attompt at explanation are hardly tmable.
Junt as somm depends on the elasticity of the air and vibrations theroly maninained and propagated, liflit and radiant beat, which are certainly incentical, most probably consist in the vilrations of some very elastic thuid. This has leen provisionally mamed Ether ( 1 . or.). If it be continuons, it may help ins to acoment for the first two catergories of fore also, as we have already seen; if not so, as is more likely, fresh difliculties arise. Lifht and heat, lowerer, are undmbtelly forms of motion, amb eorespant, therefore, to sumeh vis-viva or autual cocrey. Even heat in a liquit or solid beoly must correspond to some vis-visa in the mat rial particles, since it hat body can give out bath light and heat, and a budy may la heated ly luminons or caloritie rays which are vihatory, as we have seen.
©lass IV. contans perhaps the most puzaling of all these forets. "That there is something in common in all the forms of encetricity, ane that magnetisu is mestry related to them, is ecrtain; it is probahb. also, that frictiomal chectricity, when statBeal, consists in something anahegoms to a coiled spins, or is a firm of 1 mential chergy - the others lany forms of actual encrgy. Some have supposed mannetism to be also a form of wotential energy, lout Ampere's disenveries have materially lessenud th" puodnality , of the truth of this hypothesis. We shall comsiler this again.

## FORCE; ENERGY

Class V. may be deferred for the present.
As to Class VI., it seems, frmm the olservations of physiologists as to the formation of cellular matter, and the production in livine orqanisms of componds which have not yet been made ly ondimary chemical processes, that the vital force, if there he such. is not a force which does work, in the mochanical sense of the term, hat merely dircts, as it wore, the other natural forces how to aphly their cnergies. Were a railway train rumnine on a smooth horizontal line of rails, it wonld retain for cere its original velocity; but in turning a curve, it would be ated on hy deflecting forees, without which its path wonk les straight. These forces do no work, is is erinhent, since this wonl be shewn in alteration of the vis-viva, and none takes place. They monlify, however, the direction in which the train moves.
When gangs of labourers ami masons are at work buiding an edifice, the fromer are employed raising stones, mortar. \&e., the latter in laying them; lut there is present an overser with a phan, whi, dome no (mechanical) work himself, gmides and dirwets the proper expembiture of force ly the workine boly: In this view of the case, the labmers an the physical forees. and the owerseer the vatal force. It is "pate certain that the so-callen crystalline force canoot promerly he put in this categrys, as presenting even an inalnoy. however slight it 28 probably an effect, mot at calus. and due to the different forms of simple or compunal partiches if natere, and the consedpent variations in thair molecular forens in clifferent directions.

Silar, then, for the possible nature of the forces. which, with the prolatle exception of VI., can le considered as various forms of conerys. Can they lie transformed one into another, as the different kimels of mechanical energy can? Take the potential energy of gravitation to begin with. We can employ it to drive a water-whet. This turns a shatit, to which, if a tisht break he applige, heat will be producel by friction, and light also, if a ruugh wheel on the slaft le made to rotate argainst a prece of flint or prites: or electricity may be pombed by emphying the mosing power to then an ordinary electrical machime, ur a mountoclectric one ; and from the electricity so produced. electrical attractions ann chrrents may bu deriven ; from them heat and light again. (or the currents may be employed to nagnctise a nepille or a piece of suft iron, an to groduce chemieal decomprition.

Again, heat may be employed ly means of a steam-engime as as sulstitute for the water-powor or putential energy of savitation, and the ahove eflects le promucel. It may alsu be cmployed in raising weights, and therefore in prohucing the potential energy in question: or it may be cmployed to produce Thermo-electric lomrents, and thence all the urdinary affects of electricity, inchuting the motion of a mannetic needle.

Limat may be (mphyenl to pronuce chamal combination wh decommsition, as we see in photo. Erajhy; it may also hy the same means he mate to prohluwe clectric currents, and consernent motion of a neetle. It is not yet prowert that light can produce manetison firectly, thonsh thome can le little dombt that, if properly aphlied, it is capable of doing so.

Chemical action in a moltaic battery can be made to prowhee motion, heat, light, electricity, electrical attractions and magnetism, and to orerome other chemical affinity.

Capillary action has hen employed to probluce electrienty, and mechanical effects, de., hut we need not an through the whole category.

In these currimental resilts, then, consists what is called the Correlation of the Physical Forces-
i. e., the transmutalility of one of the latter into another or others. The inleat is chl, but the prouf of its truth lave only lecome momerous within the last half-entury. Grove has puldished an excellent treatise with the alwse title; to this we refer the curious realer fur arther detail on this interesting suliject.
Consereation of limergn. - Fut a far more improtant principle, beins, in fact, the procise statement of the preceding-which is smewhat rame-is that of the Conservation of Foree, or rather Finergy. It is simply the extension (to ath the physical inces) of the principle which we have yiven in full, and proved in a particular case, at the beginning of this article-i.e., that the sum of the pritential and actual energies of any set of monns bohes camot be alterem liy their mutual actom. Let us now suppose heat, light, \&e. to consist in vilmatory movements of particles, and in their relative states uf distortim, de., and make thr supposition that these particles act in each other-no matter by what means-in the line joining tach two. and with forces which depelad in their ilistance, and we have at once the therem. that the sum of the potential and actual murcies is a quantity unalterable in any system, save by exterual intlumes. Henee, when mechanical purber is sand to lie lost, as it is thy the mavoidatle fration in machincry. \&ce, it is really only chancel to a new form of entry-in gentral, heat. Thux, when a savane liuhts his fire, he experals andmat fince in rulimng two pieces of dry wand tagether. If these piecos of wood were ant in contact, 10 force word be repuirel to move them $1^{\text {nast each nothor-more and more is requred as }}$ they are more strmaly pressed tomether. The equivalent of this force so expemberl is formil in the heat pronluced. Dary shewed that two pinees of ice might lee nolterl liy rubling them tugether. A skilful smith can heat a mass of iron to redness he mere hammerin. Here the actual entrgy emplatil is partly given out in the shap of leat. and partly storch up, in the irm as putential energy due to the compression of the mass, or the forcible apmonimation of its particles. Amonst the earlient, amel certainly the bot experments on this sulpect, are those of Jombe (ar. .). He chetermined the relation between the mits of heat and potential enersy of gravitation. ly various methouls, which gave very nearly comenfent results. (We of these we may mention. A padille-whed is so tixed as to revolve in a closed vessel full of water. The wheel is driven by the dessent of a kuown weinht through a measured space, and preeations are taken against lusses of enerey of all kiuls. The water agitatel hy the pardle-wheel come's sum to rest, as we know; lut this is due to friction between its particles; and the fimal result is the heating of the water. The quantity of water, and also the number of retrees hy which its temperature is raised. leing measure if, a simple proportion enaldes nis to find haw many foot-pomals (see Fout-fotion) of mechanical ancy eorrepond to the raising by one destese the temperature of a ponme of water. The result is. that the heatine a pround of water vne denree fohembeit is colected by 2re foot-funds-and thas number is called Jondes Equiraleat. In uther wouls, if a lound of water fall to the gromul through 7 ia feet, and be then suddenly arresten, its temprature will be raised one derrec; and, conversely, the lieat that wond raise the tomplature of a frami of water one decre, would, if applied ly a steam-cngine or otherwise, raise 7T: promds one fout ligh. Now (see Heat uf Combication), we know the amomet of heat which is proluced by the burning (in air) of any material whose composition is known.

It fulnws, thon, that from the mere guantity and Compuritum of a substance, we can tell the amount oi mechamical work dan to its combnation ; that is, sumpong it all to la effictive As we have lean Lut to the mention of heat of combuntion, let ne connmer what this is rime to. Combustion (in airl is molely a clamieal combination of the comotituents of the burning budy with axyen-the heat aud haght which are develhecel are therefore, by the emservation of eneres. cquiralunt the ciress of putential carey of the numbinch, orer the combned, oxycen and combustibe
That this is the real state of the case-and that the erigimal setting fire to the combustale has muthing to for with the matter, as is freepuently matined - will ho math - wifent ly emsibering tuy fumatacmes combination, say that of chlorine and

 promid ap'mars as heat, lyht, and somet times smumb.
The chimalents of the "ther physical forces have not leen wen approximatel to, with the exception of that of heht. Thonsan has determined the mory of a cultic mike of sumbight at the earth to be somewhere ahnit 12, the fowt-pounds, giving ahont
 of the sun's surface. There are some alditional diftionters in the way when we seck the equivalent of electricity, for lare the question arises: © Is there a special suinstance which is, of whose motions are, dectricity, of is it macrely another mole of motion of the luminiferons ether? for we can scarecly suppose it ture rlue to motions of the particles of funtler. If the first, we have as yet no means of astimating its enerey; if the latter, we mas consilur it as within the reach of experiment. It maty merely he rumarked here, that Weber's expmisite theoretical statenont of dynamical electricity -resting on the fumdamental assumption that there are two rectrif fluids-requires the admission of matual firces, which vary with the relative velucity of its fartieles, and for which, therefore, the conservation of cenersy dees not hold.
 laltene! der Kroft, translated in Taylon's S'cintine St moins, New Series, i.), starting from the assump.tions aluve explained, has applied the principle of chnservation of furce to the investigation of many rwomlite problems connected with nost of the diysical frees. We cannot, of course, enter into his work in utetail, as it is ssmewhat malytieal, hat we may frody borrow such of its contents as wo have not alrealy allund to, at least such as with suit the phan of this article.
A wry shat examp he of the conservation of energy is finmit in the imereasing velucity of a planet or "onct as it apmonches the sum, and thas loses putential cnergy ; and also in the faet, that in the case of these lw, ines the mere distance from the sun, and the valucity at that distance, enalle us to tell at once the nature of the orbit deseribed-i. c., which of the conic sections it is.
Latent heat is a form of protential energy, depending on the physical state of the substance in which it is stored m!. The same may be said of those substances which, whem mixed, produce heat or coll, as wator and sulphric acid, or pitrate of ammomia. It is easily seen that here the heat or cold depends urom a chanse of molecular armangment of some ktul ; that is, a change of the potential enorys.
In magnetism anit statical electricity, of churses. the conservation of anery ludis, as we know that all the phemmema can bee cexplainel ly attrations ann repulsions, fullawing the law of gravitation. In the discharwe of a 1. yden lattery, the portential onergy lost is reprolueve as heat in the connecting
wires, and as light, heat, and sound with the disruptive stark. la charging a Leyilen jar by means of the chectrpmorns, the charge is directly produced ly the expenditure of mechanical force in wercming the attration of the nemative electricity of the resinous plate for the positive electricity of the cover:
In the ordinary voltaic lattery, the excess of loss of potential thergy in the cells, hy the chemical unim, saty of zine and oxygen, amd of sulphuric acil and oxide of zinc, over that gained ly the decomI"sition of water, produees the aetnal energy of the current, which may be transformel into heat, light, mannetism, or motion, or two ur mure. Or it may Ine enplayed to rejroduce patential energy by chemical decompusition, say that of water. This again, by a spark, can le reconverted into actual cnergy as an explosion accompanied ly heat, liyht, and sinind. When an clectric current canses the motion of a magnetised nedte, our general principle shomld lead us to infer that the enrent it chi will be wakenel. This is foum to be the case, hat, as it slould the, only during the motion of the needle. 'The needle in a pemanent state of deflection prombes no efliect whatever. Now, the diminution of an clectric current is simply equivalent to the addition of a weaker cmrent passing in the ofpnsite direction. We should cxpect, then, that the notion of a magnet near at conducting wire will in seneral prodnce a curent in the lattere, and this is, in fact, Firadiay's great ilisconcry of magnetoelectric induction. In this case, the curvent ceases so som as the magnet ceases to move relatively to the wirc.
If a naiss of copler or other mond conductor be set in rapid rotation near a powerfil magnet, the num imoluces electric eurrents in the copner, which, heing attracted by the magnet, sum lang the mass th rest. It is not so cilar in this case into whel the meclanial anery of the yotation has hewn transformel, especially as the electric currents cease with the motion; bint if we kerp in, the rotatom forcills, we find in a short time the conner growing wami ; in other words, the nution has been transfomad into electricity, and the latter into leat. This very heantiful experiment is due to dule and has leen refeated in a striking fumiar form ly Fonciult.

Alvantage has liecon taken loy Faralay of the phenomena of induction, to produce electric enrents l,y aid of the carth's magnetism. Ins apraratus is simply a rewalving dise of metal, and the terminal wires tumelh, , me its axis, the wher its ellge. The firce which is here transfomed into electricity is the additiomal effont requisite to turn a condacting disc, instead of an equal non-conduction one. It is a curinus consennence that in all metallic machinery a puntion of the eneryy of the prime mover is last in prolucing electricity, and timaliy heat, in the moving parts, so that heat in such cases is not eutirely, thugh very nearly, due to friction alone.
lerhans one of the most singular of these trans. formations of energy is that alvealy referrol to of heat into electricity. Certain crystals, such as tourmaline, become electritioel ly heat ; late electric curronts can be producel ly simply licating a junction of two wires or hars of difterent metals, the nther ends also being in contact. Now, if we were to heat the other junction, it is surions that as at it the metals are arranged in the offosite order, we shonlth pronluce a conitrary corrant ; conversely, by conling them we should strenythen the first. Bit the conservation of furce refures that such a junction should he hated or cooled accorling to the direction in which a cmrent passes through it. This was disemerrel ly lealtier.
thimal forer, alsain-or rather its actual encrey - is simply a trausformation of the Imtential energy

## FORCE F ENELGY

of food. This is well ilhustrated by the inereased diet which is required when man or beast abruptly clanges from a state of imactivity to one of tril, as with a polar bear after his winter's slecp: or ly the greater amount and inetter guality of food which are mocessary for criminals subject to hatd labour, than for those who are merely imprisoned.
sinec, then, as far as we liave yet seen, there is no such thing as gain or lows of energy answhere, while it aprears that the ultimate transformation of such energy is heat, and that the latter tends to a miform diflusion or dissipation, in which it is mavailable, as far as we linow, for further transformation (see lleat), whone lo we procure the supplies of energy which are requisite to maintain the ceomony of life? We answer: Chicfly, or indeed entirely from the sun, whene they conce ase lich and raliant luat, perhaps in other foms. Whithat the sun, where woald le verretation? - without the latter, Whare animal life? Whare woult be our stomes of fuel, whether woul or coal? It is entirely, then, we may say, to the directly supllied energy of the sun that we look for the mantemance of hife; and thas lents to a guestion mot of much importance to ourselves, to he sure, hat of vast future eonsegneme to the haman race: ls this smply finite? Will the sut in time have given ofl thl ats energy, of is contimally recriving aceessions itself, and if so, has it an inexhanstible stme to draw from?

Sour, whether the sun he a hat mass, or he surrommed by an atmosphere in an intense state of combustion, or whether it derives the man part of its heat, as Thomsom sujposes, from gravitation (in a way presently to he emsitered), it is certain that, as far as we know, it must at some period be exhansted. Such is the appareutly incritabie verdict of the conservation of enorgy.
The gravitatiou theory of the origin of eneroy generally may be given in sme such fom as this: The matter in the miverse, in a state of coarser or finer division, origimally tiller all space, amd possessed, therefore, by virtue of gravitation, a certain amonent of potential energy. As particles gramally moved up to each other, and became slowly acglomerated into masses, more and wore of this chergy was realised in its actnal form; some as heat (that of the sun, or the internal heat of the (ath, \&c.), some as ris-viva of axial or orbital rotation, \&c. There still rmains magrlomerated in space (sce Zomaral Light, Arrolites, Nelule) wach of this original matter still falling mainly towards the larger masses, an the sun and stars, and exchaging its potential for actnal mergy. But the latter, as we have sem, teml ultimately to hecome leat, aul to seek a unifom "lillusion. This, then, it appears, is to be the last scene of the great mystery of the universe-chaos and darkness as in the legiuning.'
An immediate eonseruence of the truth of the conservation of cuergy is the impossibility of what is usually understood by l'erpethal Motion ( $\mathrm{q} . \mathrm{w}$.) ; for it is to be carefully remembered that perpetual motion, in the literal sense of the words, is not only possible, but very general. If there were no such thing as friction, or if we had a perfectly smooth boily, in the form of a teetotum, for example, it would spu for ever in vacnu with undiminished spect. The earth in its ixial rotation affords a good example. Were it a perfect sphere, and of uniform material, the other masses of the system could produce no effect whatever on its rotation, and the latter woukl, as indeed it does, as far as we can determine, remain for ever unchanged. And cwen. as we have already seen, when one motion, as electrieity, or ordinary ris-viva, is lost, we fiud it reappearing in other forms of motion, such as heat
and light. Put this is not the technical aceeptation of the term, perpetual motion; it is popularly unkerstond to mean a somrce of motion which will not only preserve its own vis-viva unclanged, lout also dourork. This is, of course, incompatible with the comervation of energy, for whower work is done, eguivalent energy in some form or other is comsumet. As we have not, howerer, an absolute cortuinty of, thongh very powerfal evilunce indeed for, the truth of the princille, it wonld be unphitosompical to conchude that perpetual motion is absoluthly impossible. It is certam, however, that it cannot heattaned ly any mechanial arrangement; and nosther heat, light, for maguctism can give us any assistance. If we knew more than we do at prenent abont electricity, we shobld probably and it alan to the categry. The orlmary attempts which are still being made in thousands by visionaries, are simply abourd, hasel as they are for the most part on ignorant applications of mechanics. There is aboulate impossibility here; and a 'perpetual motionist 'of the common herd is far more infatuatem than a "siguarer of the circle :' for the latter's problem man be salved, though certainly not by the lucans matally amployed, or in the form usually sompht for.
We may now lriefly consider the theories of the physical forees which have been advanced of late times, and wo may take such as are worth notice togrother. All of them assume at the outset forees of attraction or remalsion between particles, or else a hishly elastic thin, or rather solud, if we may so call it, in which the particles of matter float, or are impundet. We have alrady considered the dilliculties attending the latter sumposition; but it is the culy one which loes not refer farce back to furce, this apparently leaving the question where it found it. We may dismiss it wath the remark, that a thid or guasi-suhd ahsulntely continuons and alike in every jart is difficult to coneeive; aml it is hard to moderstand how motion can le proprgated through it. If it be not continuous, forees must be sumporl to be exerted hy its parts on each other, else the motion of une jart would not affeet the others. There is me way in which the Intter diffieulty has leeen attaclied. which seems plansihle conogh ; and that is, that the particles of this thail are in a state of rapid motion, and contimally impinging on each other and on the partieles of matter, no forces leing exertel except those of pressure at the impact. But, noless these particles hie supmened elestic, and what is elasticity lut a form of molecular force (force aguin), their mution would ba lessened at every impact, and destroyed completuly if the impract were direct. This oljeetion seems to be a very strong one. The first-mentioned theory, that of Epinus and Mosotti, assumes that material particles tloat in a general atmosphere of ether, that the particles of each repel one another, but that a particle of matter attracts one of ether. From these suppositions, and an hypothetical law connecting pressure with density in such an ether, Mosotti has deduced gravitation and the molecular forces; lut to apply the hypothesis to the other physical forces, other suppositions are necessary. These have been surplied by Clausius and liedtenbacher, who, with the assumptions of particles of matter and of ether as before, imagine those of matter to attract each other, and also those of ether, lint the latter to be mutnally repulsive. light and radiant heat, according to this theory, are vibrations of the ether which fills all space between the particles of matter, or rather, between the atmospheres of ether which, by the foregoing assumptions, the particles of matter will colleet about them. Heat consists of vibrations of the

 is, however, dependent on the will of the injured party. 'A contract made moler dhress may lre averdell by the person whase freewill was thus restraned, thongh he lats also an eloction, if he thinks proper, to insist upon it as a hmolmig trans-
 sontitleat to treat a emontract aither as a mullity or a sublisisting eontract, must mak their eloctom, and canarot, after treatiner the contract as reseinded, set it up as a subsisting comatrate (Addison one ('ontructos, 11] : $27.3,436$, and $1(174)$.

FORCELII'N゙I, Eimina, an Italian philolocint of great attamments, was born on the: -6th of Anyust GGS5, in a village near I'iuduas. Owiner to the limited means of his family, $F$. was heprived of the bedretit of early instruction, ami wis alrealy ver, ing towames manhood when enabled to cominence a resmar conrse of staly in the seminary at larlua. Ilis zealons industry, eombined with innusual [uwers of learning, singled him out from his companims, and won the admiration uf the learom mincipal. Giacomo Facconlati, who even associated him with sume of his own scientitic latomws. The pmat rambered his teacher valuable survien in the comspilation of a hiphly impurtant loxienn, a work which probably inspined lonth with the project on which l'.'s laterary repute is hasod-viz, tha compilation of it vast and comprohensive vocalnlary of the Latin langanes. The work was pmhlished atiter P's death, and promonneed by puble voice as one of the most valuable adquisitums to philolurical science of the age. In adrlition to tha Italian and Greek signification of the Latin worl, the hateral and
 a collection of examples, in themselves a perfect compendinn of knowleage, cmbareinif the costoms, laws, arts, scioncea, religinn, and histary of the limmans. This immense wotk was prablished in 4 vols., folio, moler the title, Topizas Latimimis Laricon,
 forcollini Lowabratum (Falua, 1751). Furlinnetto's appemtix apmared in Islb (l'alnat, mod a new chation of the complete work wats prablashed in 180s (ladua). F. died in 1768.

FORCENE, said, in ITerallry of a horse when rearing, or standing on his hinder lues.

FOIRCEPS (Lat. a pair of turgs or pincers), the name given by surgems to an instrument of great antiquity, usel as a substitute for the tingers, and consisting of two levers of metal jointed together erosswise, nearer to one end than the other. The haml grasping the longer ends of the levers or handes, closes the shorter ends, which are shaped
so as to seiza hirmly the intenctonl object. There is searcely a smrgical uperation in which it is not appliedi and it is made uf varimes forms, to suit different cases. In allution to the forms used in Dentistry (1. v.), thwe is, 10 of, the disweting forceps, which has roughemed pints, to lay lowh of small portions of tissme which are to be dividad by the linife: the lithotomy formes, agrain, has lidales concave like spoons; and pimeatrotid forceps have apertures in the lolales, amil as the suft tissines projuct into these, a firm hold is mhtamed with less risk of tearing the barts. By means uf Liston's culliuy forceps a powerful haml ean divile a croat thickness of bone. But the most impurtant of all is the minuifiry furecus, th invalnable inventinn, in cases of differilt lavery, wheh daily rescues from suflering and dancer numerous mothers and infants. It was gralually brought to its present perfection: lut the name of chamberlen, an acenmelnur of the time of James IJ., is associated with it, as wne of its chicet improvers. It consists of two concare fencstrated hiales, forming a ravity into which the lean of the chnld fits. The blules are applien semarately, ond to each site of the leval, and then leveked torether. Holding by the handles, the acconcherm aids the natural' eflonts of lathour. 'I'le instrument does not necessarily or gencrally injure either mother or clud.

FOle ${ }^{-1} \mathrm{INC}$, in Cimomin, is the artificial application of heat to aceverate vegetation. The term is not nsually applied to the cultivation of exotic plants in lothonses, whore the object is to inatate as mach as possible thoir native climate; lout it is structly applicable to the system usmally pursucd with vines and gine-aples, to seenre the froductan of fruit at desired seilsoms, amd hy different plants of the same kind in sumessinn thronula a tonsideradde period. the heat boing incleased for ond set of plants sumber than for another. Many of the frits and vergetables which grow well in the open air, are very commonly joncel, in orver that they may le promured at seasons when they conld not withont artificial means. Thas, seathalt and rhubarh are foreed by neans of the heat problueed hy heaps of fermonting litter, by which at the same thme they are blanchont, and to this we owe their appearane in the market viry early in the season. Potatoes, pease, kilney-brims, asparatms, sabikls. \&c., are uften formed by mons of hotleds, or in Hueal pits: or a pace is fommal for them in hothomes. trawherries are cultivated in futs, and foreed in hothonses : and some kinds of fruttrems are oftom treated in the same way. particite laly charies; and very diminnture trees may be seen riohly lowled wath front. Certain varicties are regarded liy gardeners as partitularly suitable for forcine. I'he system parsued in the Oreharel-house (r. そ) eamot be called foreine.

FORD, FORDING. When a river or rivalet is erossed without the aid of either a lridge or forrs. it is said to lee forcmel, ant an established blace for this erossins in calleal it foml. Thus, wo have Oxford, Stratford, Therford, Iluarcrford, \&c., towns bult aromul ancicut furs. To the military cumecr and the trazeller in wild emontries, the selection of the safest place for fording a river is a mattor of some practical impurtance. In the first place, the widfol part of the river shomld be wosen, as, wherever a ecrain quantity of water is Hnwins, the wher its bet the rapelity of the How being the samu-the shallower it must be. At the beml of a river, the lime of shallow water does not run straight acruss, but extembs from a promontory on one side to the nearest pomontory on the other. The streim usually runs deep along'
bothow carves. ami heneath steep propentionk and werhomang hanke, whilst it is always showl m tront of promintories, maless the promontary is formal by a jutting rock. Fin sate fording on fimet, the depth of water should not exened three feet: on horsehack, former ient or a foret less for cach, if the eurrent he vers strong. The buthon of a ford shank le tiom and even; weols, hache of stome, \&e. are serinus whatiaches, espectably for eattle: When a carasam, a manalur of trous, of of cattle, have to cruss a sambly bremm is firy ban, for the samd is storred up aul carried away ly the stream, and reburs the ford impractuable for the himbenst. fior a suatl party, hated satud or gravel is the safest hottum.
'The jalabitants of a district gencrably know the safiat fimbls, and there exprome allords a loutter gande than the best rules that can he given. Fords are conthatly varying either from the swelling of the rwer of the shatin: of its hed or hanks, and therefore it dans not fullow that the place set dows hy one traverler ats is sate furd, will continue so for the next that suceed.s him.
Fonll), Jouns, an Enclish dramatist, was the scom! son wh Thomas lom of Ilsingtom, in the comuty of Disom. The date of his hinth is not kimwn, hat ho was baptizal in llsington Chureh, lith A Anil lisit. ITis family was connecten with the fanms Lerd (hicef Jnstice Popham, and he beame an momber the Jidhe Temple in Novemher lown : his consin, a John Fond also, at the same ferion being a member of Gay's lan. Unlike many mombers of the puetic tribe. F. seems to have adhered to his stumes, and to have attained some professional sucess. Dis first form was an elegy in the death of the Earl of Ibermshare, entitled Foume's Menmotel, and sulsequently he assisted in the compenition of rarions phys: perlaps, from his eonjometan with Welnster anil becker, in this way lue napuirel, or at least whettel, his appetite for tragie homors. In 1629 , be pronluced The Lum $\begin{gathered}\text { s. }\end{gathered}$ Mrlunduly: and fonr vears after, The Brohen Incot.
 besh: and in libes-16:3, The Pancics ('luste and Fohk, and The Lulys Trich. After this, F. drops wht of literary histury. Some think that he died som after; whers, that he retired to his mative place, married, and livel to an old age, with sons aud danghters \{rowing up around him.
F. takes hirh position as a dramatist, and this fosition he attains more by general mental force than by dramatic instinct, or by what we are aecustrmad to call protic genins. In his compositions, there is a sense of effort; his writing lookst hke taskwork: and one ean hardly suppose that he enjoyed his work. IIs versification-eyen when the subjectmatter is distinctly noble-is hard and prosaic. Ite has no hamour. He has been praised for his fathos, but in his mathetic scenes effort is apmarent. He cantot 'flatter' you to tears, as Shakspare and the greater poets ido. An elition of his woms, fublished ly Elward Moxen of London (18t0), is conicheal by a liompaphical notice and critical estimate from the pen of IIartley Coleridge.

FORDUN, Joms of. Nothing more is certainly known of this early foottish chronicler, thau that he was a seeular priest, and wrote about the yoar 1:3s. It has been inferred from his name that he Was lorn at Fondm, in Kincardineshire, and it has luwn said that he was a canon of the eathedral church of Aberdeen. Having proposed to himself the eompilation of a chronicle of Sentland, he is sail to have travelled on font through britain and Irolaml in seareh of matcrials. He lived to write mly five laykis of his scotichronicon, lringing the 4
history down to the death of King David I. ill 1153. He loft collections extending to the year 1385, about which time he is supposed to bave died. The work "hich lohnof r . hat left untinished was resumed in the year 1441 by Walter Bower, ablot of the monis. tery of Anstin Camons liemular, at luch Com, or st C'iln's Inch, in the Firth of Forth. He enlarged the live bonks which F. had completed, and making use of his cullections so far as they went, wrote eleven now broks, lringing the Scotichramicon down to the murher of King Jimes 1 . in 1437 . The dearth of other :anals has given more importance to the work than it could claim from its literary merits, which are scinty enough. It has been printed more than onec, the most complete edition leing Wialter Goodalls, published at bidinburgh in 1750, in two folios. This includes both F . and bower. The best edition of F .'s work, as it was left by himself, is Thomas Heame's, published at Oxfori in 1720. There is rom for a new edition, which shomld give a collation of the best manuscripts, and distinguish what is F.'s own, what he copied from others, and what Bower interpolated into his text.

FOlaE (i. e., first), a term applied to the front or fommost part of a ship. The forehole is that part of the hold intervening hetween the cutwater and the foremast. The forecastle is that protion of the upper aleck extending from the formast to the bow; it is the part to which the common sailors have free aceess, and probably derives its name from a small turret or castle placed near the prow in ancient vessels, from which darts and other projectiles coudd to most conveniently harled upon an enemy. Foremust is the first of the three mists, or of the two, when only that number are present. It is surmantem liy the foretop-mast, foretopmillimetmast, anml forernyal; its sails being foresau, foretupail, \&e.: lutween it and the bow dies the forestaysail, hoisted on the forestay, i massive rope passing from the foretop to the bow, ank, with the backstins and shouds, maintaning the mast in a perpendienar position. The fordraces are ropes bassing from the extremities of the foreyard into the mantor, whence they descend throngh pulleys to the deck, where they serve, when necessary, to alter the clirection presented by the foresail to the wimi.

FOle ECLO'SURE, in English Law, the process by which a montgagu failing to repay the money lent on the security of an estate is compelled to forfeit his right to relecm the estate. Every person having montraged his estate, is entitled to an equity of renlemption, which can only be cut off by a formal process. For this purpose, the mortgagor files a bill of foreclostex, praying that an account may be taken of the principal and interest due under the mortrage, and that the mortgagor, on failing to pay, may furfeit his equity of redemption. If on the day tixed for payment, the money be not forthcoming, the mortgager will be declared to have forfeited tris eguity of rellemption, and the mortgagee will be alluwed to retain the estate in jerpetuity. Seo Mortgage.

FOREIIAND RENT. In Scotch Law, rent is said to le forehand when it is made payable beforo the crop, of which it is the rent, has been reaped. After the perion when it is due and exigible, forehand rent is in bonis of the lessor, and passes to his executor, not his heirs (Bell's Law Dictionary).

FO'REIGN ATTA'CHMENT may have refer. ence either to person or property. A defendant who has been arrested or attaehed in a foreign country, may be again arrested in England on the sime gromod of aetion. Thus, where a defendant had been arrested abroad on an Eaghish judgment, and

## FOREIGN AUNILIARIES-FOREIGN COURTS.

escaped and came to England, the Court of Queen's Bench decided that he may he holden to bail in an action on the jurlsment. But after an arrest in Jreland or Scotlanil, the defendant cannot, in general, Le asain arrested in England for the same debt, neither of these conntries being deemed foreign tu that effect (Wharton's Vic.). Under the sane name, a proceching for sccuring the debts due to the defendant has been inmemorially user in the eities of Jondon and Bristol (Stephen's Com. iii. p. 663, note): and by the C. L. P. Act of 1554, a similar procerding has been adopted, hut with this diflerence, that whercas by a fureign attachment in the Lord Mayor's Court, debts are attached for the purlonse of compelling the defendant to appear and [ut in bail to the action, no such froceeding can take place in the common-law courts till after judgment. See fanciniment. In Scotland, where a creditor may both incarcerate a debtor aud attach his effects. an English ereditor may attach the property uf hise rehtor, thounh be has imprisoned bim in Englamd. Sec Atpachment, Apprehend, Afrest, foheron Covirs, The corresponding phrase in Sootland is Arrestment, which has reference both to jurson and goods, and is a proceeding at common law applicable to the whole country. As to the validity of a Scotch arrestment, ad fundandom juristic. tionem, to enalle the Seotell courts to procecal against a foremer though absent, see the recont apreal case of the London and North W'estern Liailway Co. r. Lindsay, Macqueen, iii. p. 09.

FOI:EIGN AUXILIAliIES. In the early periods of Linglish history, foreign anxiliaries were by no means uncowmon. Harolil hat a body of Danes in his army when he defeated the Ninwegian king ; and to their refusal to march arainst the kindred Normans he owed not the least amone the compliations which nltimately overwhelmed him. lassing to modern times, William III. Hal for some time a body of Duteh tronps in his pay as king of England: throughont the 1Sth c., Ilessian aud IIanoverian regiments were constantly in the pay of the English government for temporary purpuses. Jlessians fought for us in the tiost Ancriean war; and the Landyrave of IIesse, who soly his tronjs at so much a hearl, receited upwards of half a million for soldiers lost in the eampaign. Juring the Jrish rebellion, again, in 179S, wany Jlessian troops were employed.

On the outloreak of the continental war in 179 , it was determined to recruit the Eritish army ly the addition of a large body of foreigners; ams accordingly, in 179t, an act passed for the embodiment of the •Kine's German Legion,' consistiner of 15,000 men. These troops, who were increased in the course of the war to nearly drmble that number. distineruished themselves in various engarements, and formed some of the regiments on which our generals coull best rely: Comps of French émionés, as the York liancers and others, were alsu organised. The whole of the foreign legions were disbanded in 1815 , the ullicers being placed on lanf-jay.

During the linssian war, in $15 \% 4$, the Pritisla govermment again lad reconrse to the enlistment of foreinnors; special provision being made in the act authurising their employment, that the arms of the legionaries were in no ciase to be used acainst Britus sulojects, in the event of internal discord. The numbers to lee raised were 10,000 (iermans, 5000 Swiss, amd 5000 Italians; the pay to be the same as to British troops, but temporary service to convey no claim to half-pay. About half the mamber of men were enrolled, and were said to have reached great efficiency, when the stoplage of hosthlities arrested their progress, and causcd them to be disbauded at a great cost for gratuities, \&c.

An attempt was marle to locate the Germans as military settlers on the frontier of Cale Colony, where they should at once be a prutection against the Kafirs, and a valuable adilition to the labour in the castern provinces; but partly from the paucity of females in their commumaty, and partly from the tempitation to abscond, oflered lyy tha hinh wayes in other parts of the colony, Stistorphem, as the settlement was aalled, has himl indificrent suceess. Nany of the soldiers of the Italian lomion subsequently turned their training to grood account nader Garibaldi.

Troupes étrangeres form a permanimt portion of the French army, where they are hohl in croud esteem; they are usually Swiss, who are always willing to sell their services to any power, what ver the eause, prorided only that the jray is groul. "Ilne throne of the late Seapolitan monarchy was latterly unhed chicdly by Swiss mercenaries.

FOIEICN EILL OF ENCHANGE is a Hill which is either both drawn and accepted abmond: or drawn ly a persum residing alroad on a 1 nason in this country, of the reverse. If a bill he drawn aloroml, and aceepted in Enrgland, it does not retpire a stamp; but if drawn in this comatry upon a eorrespoudent abroad, or a forejga luuse, it must be stamped ( 19 and 20 Vict. c. $97,5 \mathrm{ss} .6$ and 7 ) ; and wlen drawn abroad, it must be stamped ly tha homder, before he cau prosent it fur logment, or indouse, transfer, or otherwise acgrotinte it within the Cnitul
 however, been decided that the stat. If and is Viut. c. si, s. '? does not render a stamp necessury where a bill drawn aloroad has been indursma abraid tor at person in Encland. and presented ly him for aceeptance in Enslant (I'hillimure, Internatiomul loter, iv. Go!9. Formerly, a bill drawn or jayable in keot. latnd or lreland, was foreigu in England; hut such liills were made inland lyy the statute just muntioned; and the same resulation was extombed to the islands of Man, Ginerusty, Jersey, Aldmater, and Sark (s. 7) . See Pill. It has lmene entalolisheel as a rule in England, that the liabilities of the drawer, the accepter, and indorsce, slatl be governed by the laws of the countries in whell the drawing, asceptance, and indorsemont respectively tomk pace (1'hillimore's Intermetional Litu, iv. b. 606 anll boli), In the case of bills which are both drawn and accepted abroad, and which are thas in yoality fureign contracts, but of which the accepter is a native of this conotry, and which are somblat to be enfored in the conrts either of Fingland or sontlamul, a distinction is made between the comtract and the remedy: "Whatever relates to the nature of the obligation-ad valorem contractus-is to be noverned by the law of the cuntry where it is made-the lec loci ; whatever relates to the remedy, hy snits to compe] performance, or ly action for a lireach-ad decision $m$ litis-is governed hy the lest fori-the law of the country to whose courts the application is made for prerformance or for danarges. Lonl Brougham in Don $\because$ Lipman, llouse of Loris, 20th May 1S37; Shaw and Daclean, ii. 1. 7:3.

FOREIGX COURTS. Kent, after stating that in cases not governed by the constitution anul laws of the United States, the doctrine of the Einglish law, as to the dince and effect to be given to foriga julgments, is the law of his own enuntry also, observes, that the law thus common to bngland and Americia' is exceedingly, if not peculiarly liberal, in the respect which it pays to foreign julgments, in all wher cases excelt the case of a forcign divorce or an Finghsh marriage. A distinction was early taken by Lord Nottingham, and is now recomised

horses. Iligh-ired horses with smouth hair are most liable to this ammaner. The female F . F . does wot hemosit her egges until they have reached the pupa stage in her ahmmon. One unly is producel at a time, enchosed in a tombla, strone skin, egg-like, lack, and shiming liku a lead, womberfully large when the size of the alnomon from which it came is considered ; the perfeet insect tivally emerges by hursting olen a kimul of lid or cap.

FOREST LAWS, in Enchal, laws for the regulation of the royal furests. loorest is definem lig Lord Cuke to be a sate perserse fire wild amimals (ficrs) of the chase, whence romes the torm fousesto, by the change of $e$ intus ( $1^{\prime}$ o. Lilf. 233 n). In, ith words probally spring from the sane ront as the Latin form and the French hors. and simify that which is without the range of the jeophon or cultivated combtry: Hence the Italian formetere and formo, and the spunsh fimentro, simity strame. foreign, wild, and the like. A forest, in the sense of the law of Boglame, is a layge tract of open gronnd, not necessanily covered with wiml, but usually contaning woulland intersursed with pastme, and forming part of the property of the monarch, and gaverned ly a spectial come, called the forest law. This particular law han reference not only tor matters conmeetol with hantins and the like, but womally gomen the persans living within the forest in all their relatims. A chase is a smaller for st, in the ham of a subject, thet mot governed by formet law. Thengh the privhege of forest belongs of right to the sowmign alone, it may be sranted les him in favour of a subject. who fecomes entitled io exereise the priviluges of forst in the district asoighen. This right was exereised hy the saxom limes, whe reservel large tracts of country for the rigal pastine of hanting, and a charter of the forest was said to have leen passiad by Canute at Winchester in the year lolb. lint the authonticity of this domament is dombend ly
 greatly extended the royal forests, by laying desert vast districts in ILmaphire and Yorishme; lue also introducel punaltio's of the sememest kinil for oflences against the game: The bualty for killing a stay or lanar was luss of eyens for William havel the erreat game te if be hat lee on their father was. (kronick). It was mot till the reish of 11 my 111. that the laws of the forest were reduced into a recular cole. In the reign of that momerh was passed the charter of the forest. 911 enry 111. (., 1, 1 -24 ). The right of the surereign to creat: a forest is loy the common law contined to lamis of his own demesne. Henry II. had arthtrarily exacised his paser ly affuresting the lame of his sulijects; lat liy the lst and inl chapters of the charter of the forest, it is provided that all forests so made should be dis. afforested. At a subsequent time, when Henry V'III.
ereaterl Hampton 'ourt lowst, he was obliged to aldain the consont of the frecholders before he could wect a chase or forest over their grounds (Coke, Imot. is. 301). N1r Hallam remarks!' It is well known that Charles I. makle lithmond lark ly mans of depriving many proprietors not only of their common rights, but of their frecholel lands. It is not clear that they were ever compensated; but I think this probable, as the matter exciterl no great clamour in the Labs I'arliament.'- IJallam, Const. II ist. i. 463, minte, lit el. Ly the chanter of the forest, the $\mathrm{l}^{2}$ nalties for hostroving same are Ercatly moditiod. By cal, 10 , it in providen that no man shall hase hife or limb fon whing deer, beat that the pmishmant shall he restrictal th time or manisumbent for your ant lay. ('ap. Il comtains the following chrions privilege: "Whatsoever arehbishop, lishop, earl, or batm, coming to us at nur commambment, passing by our forest, it shall be lawfal for him to take and kill one or two of our Wecr by view of our forester if he he present; or else lue shall canse one to bow an horn for him, that he seem not to steal our heer : and likewise they shall An returning from us." This law is still unrepealed; so that a lishop, may hill the Gueen's deen When summoned to, or retuming from parliament. tharles 1. attempted to till his empty exchequer ly impusing penalties and exating fines for alleged encrouments on the ancient hombaries of the foreste, thoneh the right to the lands thus taken was fortitied by prssession for several centuries. This was one of the tirst grievances with which the Loms Parliamont dealt, and since the passing "f the act for the 'certainty of forests' (16) Cat, 1. c. 16 , the laws of the forest have practivally wasul. In 'rlor's time, there were sixty-nine roval forests, all of which, with the exception of the New Forest and llamitom Cont Forest, han heen creatial bafore the prind of record. Of these, the prininal were-the New Forest. Sherwoul, Deal, Wimlsor, Eppuing, Wartmonr, Wichwow, in Uxfordshire, salecy, Whittlebry, and Ruckimsham, in Nirthamptonshire, Walthan, in Lincohshire, and Kiehmond, in Vorkshire. During the present reign, several of the royal forests have heen disafforested by act of parliamentllamanlt, It and 1.5 Viet. e. 4:3; Whittlewnol, 16 and 17 Vict.e. 42 : Wichwom, 19 and 20 Vict. e, 32. loublic necessity is the ${ }^{\text {the }}$ an which these spots, lons so famons for their siltan scenery, have been combemmol. The plea is one which cannot be
 that it will mot la sutfered to presal to the entive destruction of one royal forests, some of which,
 pulize recreation hiogly prized ly the citizens, and which never cam le equalled in beanty and in healthitulness by any new-made pleasurnisumbl.
The royal forests of contant, in ancient times. secm to have been nearly as mumerous as those of Lingland. In Perthshire, there were the forests of Athobs, Dambon, Glenatmey, Glenfynas, Glemalmom, Bimam, Cluny, Alyth, \&e. In Forfarshire, there wore llatan, Nuntrethmont, Kilgery ; in Rincardineshire, Cowie and Dorris: in Aberdeenshare, the Storket, Dsce, Kintore, Benachic. Drmm, In rese, bramar ; in lanffhire, the Boyne and the Einzie: in Ahrayshire, Darnaway, \&e. South of the Forth. there were the forests of the Torwonl, ${ }^{\prime}$ adzow, Lettrick, Selkink, Tellhur,h, Traquair, the New Forest in humfriesshire, de. "The Leyfes Forest. "rom-the senttioh Forest Laws-have leen printed nure than men ; the best calition is in The Acts of the Pertiomonts of scothone, vol, i. pl. 323-32s (Lelin. 1844). The forest corle of Srotland, though neither so complete nor administerth with the same
risur as that oi 1 mand was stall gememally onm-
 restrants. "lhe gratat of a right of dorestry conferrent the same privilege as if the gromal over whels it extented hal heen oricimally, and hand contune it on he, anges forest. Hence arose great opression amb amoyate to nejuhturing proprictors, and in lisut the supme chivil comet sugerested that a representation shonded be mate t. the king agninst the grantmg of new furests. lirom a case whath has just beon ilecheded, it wond ane that the hiah pretedstoms of ryyal foresters have in some Ihaces sursived to the mosent day. The Dukes of Athole still hoh the extemsive mimatamons ristrict ealled the forest of Athale, cithor in their own risht or as foresters for the crown. In virtue of his rights of forestry, the present chake chamed the power of preventing his wichbour, the Laide of Lade from killing deer on his own lands, and manataned that he was bound to allow the duke ant his keepers to enter on his lands, and drive back any deer that minht stray unn them from the forest of Athule. Bint the conut decihed (March $1,180^{\circ}$ ) asainst the duke on both points.
Forest Courtm were counts cistablished for the purpose of enforcing the forcest laws in the royal forests. Of these courts, thare wore in lingland four-viz., the Comet of Attachments, the Court of Hesard, the Court of Swainmote, and the Court of the Lord Justice in Eyre in the Fortst, or Justice Seat. The last Court of Justice Seat that was beld where lusimess was transacted was in the reign of Charles l., before Lord Ifolland.

FOREST MARBLE, a member of the lower Oolite, so called locease of the occurrence of the typical leds in Wichwoot Forest, Oxfordshire. The $p_{\text {rincinal }}$ bal is a dissile limestone, contaninor large numbers of dark-coloured shells, and capable of sustaining a tine polish. On this aceonnt, it is used to some extent as 'marble. It is interstratified woth bue marls and shales, and tine oolitic sandstones. The whole thickness of the group selion exceeds forty feet.

FOREST O.dk, a name sometimes given in commeree to the timber of Cusumine formbosa, and other species of (chsuarina ( q . \%), Anstralian trees, This timber. which is light yellowish hrown, amb prettily marked with shurt red reins, is imported into britain, and used for ornamental work.

FORESTALLiNG. Sce Engeossing.
FORESTS, Sce Arborichltre.
FORESTS, Fosst, have been frequently olserved in the eosal measures. The seams of eobll having in general bern formed from the vegetation of the locality where they oceur, it is to be expecterl that when the eoal is removed, the stools and roots of the trees would be observed in the inmediately suljacent bell of shate-the ancient soil. Such a forest was hain bare in an ogen work at Parktied Collicry, near Wilverhampton, in 1S4t. In the spmee of abont one-fourth of an acre, the stumps of 73 trees, Ground plan of the Fossil Furest with their roots at Parkfich Culliery. attached, appeared as shewn in the annexed ETrmai-plan. The trumk, hroken off clase to the ruot, ware lying prostrate in every direction. often crossing each uther. One of them measural 15 , another 30 fect in length, but they
were generally shorter. They were invariably converted intio coal. and flattened to the thickness of I or ${ }^{2}$ inches. The upright stems shew that some of thoms had a circumference of more than $s$ fect. Similar fussul forests lave been observed in the coal-tiollds of Nowit sontia, amk have heen carefully described by Lyell, Logan, and Dawson. The ushal hoint of the trees anserved ly laedl was from 6 to 8 fect: hut one tree was about $: \bar{s}$ fent hinh, and 4 feet in liameter. lirogniart deserines the remains of a fussil forest prosersed in an upright $\mathrm{I}^{\text {mition, }}$ in strata of micaceons sandstous, lebluging to the coal measures at st Etionme. near Lyon. Thungh most abmmant in strata of the earboniferons frembl, fussil forests have been whered in other formations. The birt-bed ( q . x ) of the Lower loubeek series is the romans of an ancent forest. Instances are also abumbant in the plocene strata. Sometimes, as on the coast of Bevonshire and ou the shores of the Firth of Tay, they are exposed an the suffer, stretcling from high-water mark to far belew the furthest limit of low water; or they are exhibited in section, as in the clitts of Eastem Norfolk, where, resting on the chalk or eras, there is a stratum in which the stonds and roots of the trees stand in their natural gusition, the trumks haviny been broken short off, and inbedted with their hranches and leaves. 'Mhis stratmo is covered with fresh-water bods and drift. The position of these forests indicates a variation, in recent geologieal time, of the relative level of hand and water. The instances in Devonshire and Fifeshire may imply a simple sulsidence of the land; at Norwich, however, a eonsiderable depression must have taken place, to admit of the deposition of the fresh-water beds and the till, and a subsequent elevation, to expose the beds so bigh above the sea-level.

The remains of ancient forests, belonging to is Yet later perion, are to be fomm in beds of peat. There is good evidenee that some limels of peat had their oricin in the destruction of forests. Trunks and branches of beech, hazel, fir, \&e., are fom in them, and their ronts may be traced in the unterelay. The rapidity with which this peat is formed is very remarkable. At Blair-Drummond, the stratmo of peat is eight to ten, and in some places even twenty fect in thickness. Many of the trees here have been felled with the axe, and that this was done while the liomans were in possession of the comtry, is proved by the diseovery of 'corduroy roads,' leading from one eamp to another, and the finding of camp-kettles at the bottom of the peat.

FO'liPANG, or FOREFANG (Sax. fure, hefore, and fienem, to take), the taking of provisions from any one in fairs or markets, hefore the king's purveyors were servel with necessarics for his majesty. (C"harter of Heury 1. to the hospital of St Bartholinmew in London, anno 1133 , referred to in Tomlia's Dic.) It is also used to sirnify the rescuing of stuben or strayed cattle from a thief, or from those having illesell possession of them; or the reward fixed for such resene (Wharton's Dic.).

FORFAL, surposed to he the ancient Orrea, the county tuwn of Angls or loofarshire, sitmated near a small lake of the same name, on a rising.gromad of no great height, in the fertile valley of Strathmore I'op. (15:1) 11,031 . It has been a royal lourth since the reign of king David 1. (110tllis). It lad a royal castle, of which no vestige remains, said to have been situated on a round hill, on the north side of the town, and to have been destroyed by order of kiny liolvert Bruce, in the year 1307. Its staple manufacture is linea.

It is convected by railway with Aberdeen, Arbroath, and the south. It jrins with Montrose, Arbmath. Brechim, and Bervic, in sending a representative to parlimment.

FORFARSIIRE, or ANGUS, is a maritime connty in the east of Scothind, toing bounder on the E. ly the German Ocean, on the N. hy Kincardine and Aberdeen shires, on the W. by l'erthshire, and on the S. ly the Firth of Tay. It extends from north to sonth 38 miles, and from east to west 27 milus, with 45 miles of coast. There are several vallers of considerable extent, the principal of which are Ghon Isla, Glen Prosen, Glen Esk, Clova, and Lethnot, which are all well watered, and mostly productive. The surface of the county is irregular, and it is intersected with hills, the sidlaw being 1400 feet high, and Catlaw, the highest, $226 t$ feet. The soil, which is various, ranging from the finest alluvial to the moorish, rests mostly on the old red sandstine and the trap. Devonian pavingestoncs, limestone, porphyry, and jasper, ocenr. The chicf rivers are the Tay, North Eisk, South Esk, and Isla ; and there are some small lochs. F. is the chice seat of the Scotch linen mannfacture. Cattle, com, salmon, and pavingstone are the primipal exports. The climate par. takes of the qualities common to the east coast. The averase of the fall of rain is alout 2.5 inches. The valuef rent of the conty in 16.4 was $£ 171,440$ Scots, or $£ 14,257$ sterling. The valuation for 1572 - 1583 was 26220,935 sterling, incluthong $x^{9} 98,492$ of railways. In Jsi-, the last year in which the agricultural statistics were taken, the total acrease in the county of all kinds of crons, bare fallow, ani grass, was $241,49: ;$ under com crops there were 93,507 acres; under green crops, 51,237 ; and of clover, sanfoin, and grasses under rotation there were 69,529. The tutal number of eattle returned for IST2 was 49.320; sheep. 116,109 ; jugs, 7127 . The number of horses used solely for aqrieulture. \&ce, returned by occupiers of land in the sane year, was 9321. Pop. (1571) 037,528 , being an increase over that of 1561 of $30.83 \cdot 2$. The chief towns are Dundee. Arbroath, Montrose, Forfar (the county town), Lrechin, and Kirriemuir, The cumety returns one member to parliament, and the boroughs two. Angus was the pravince of a Mornater during the Celtic period of Scottish history. It ap pears as an canhum in the 12 th ecntury. Its first farls were probably the clescendants of the old Mormarrs: it passed subsequentily to the Tmphrawilles, the Ntowarts, and the Douglases, The castle of Fortar was the residence occasionally of some of the kings, matil the time of Alexamer III. The chief antipuities are some Roman camps, the ritrified fort of Finhaven, the remarkable stone forts of the White Caterthun, near Brechin, and of the Laws, near Dundee; the sonlptured stone fillars at Mcigle, Aherlemno, St Vigean's, Glammis, Kirriemuir, Aldbar, Invergowric, \&c.; the fontified island of St Margaret's Inch in the Loch of Forfar, the round tower and cathedral of Brechin, the ruins of Restennet Priory and Arbroath Abbuy: and the old haronial castles of Glammis, Fied Castle, Elzell, Melgund, Finhaven, Airlie, Careston, Inverguharity. At Stracathro, it is said Balio! resigned the crown to Edward I. Soveral eminent men were horn in this county-Hector Boece, Andrew Melville, the Marquis of Montrose, Joseph llume, Sir Alexauder Burncs, Rohert Brown the botarist, James Mill the historian of British India; and Grabam of Claverhouse had a seat at Fintry Mains.
FO'RFEITURE AND CORRUPTION OF BLOOD are penalties consequent on convictions
for treason or fulony. The pemalty of forfeiture for treasm is fommen on this consicleration, that he who hath thas vidated the tirst pmaphes of government, and broken his pirt in the origiual contract between king and Irempe, hath abandoned his connectiom with society, and hath no longer any risht to those adrantages which before belonged to him furely as a member of the commanity (Stephen's Com. is. 497). The penalty of forfenture for treason prevailed in England before the Comqnest, as is clear from the fact, that lanels hed in savelkime, which is a saxon tenure, may be forfeited for treason. But after the Conguest, forfeiture of lands and gromels came to be regaded as the jeculiar pmoshment of felony, of which treason against the sovereign was the highest kith, and was denominated high treason, to distinguish it from all uther felonies, which were called pretty treasion. In cases of treason, the offender forfeits all his lands absolutely to the erowa, In felony, according to the ohd law, the officuler forfeited to the crown the profits of all estates of freehold during his life, and all his estates in fee-simple for a year and a day, after Which they became escheat to the lord. The crown, during the year of occupancy, was entitled to commit uron the lands what $W$ aste ( $\mathrm{f} . \mathrm{v}$. ) it pleased. By Magna Clurta, this fower of committing waste was restranined. But by $17 \mathrm{Ed} .1 \mathrm{I} . \mathrm{c}_{\mathrm{c}} 16$, the Kiny's title to waste was again recognised. As the law now stands, murder is the only felony by which forfeiture for your and day is incurem. In all folonies, the gonds and chattles of the offender are, on comviction, furfeited to the crown; but until conviction, forfeiture of the goods does int operate. Where, therefore, a person has tisisused of his gomeds hefore conviction, the crown camot reach them. Forfeiture of lands oles not take eflect until sentence of Attainder ( 1, ,. ) has been promunced. Su that a person committing Pelo de se (I. $v$. .), or a rebel dyin: before sentence, or killed in ofren reluellion, does not forfeit his lands. But sentence of attainder, as soon as pronomeed, has a retro-active effect, ami annuls all convegances made letween the aet of treason or felony ant the pronominer of sentence. Comveyances made lafore the act of treason are not aflucted. Hence, a wife's jointure is mot forfeited, because settled on her befure the commissinn of the act. But dower is forfeited lyy 5 and 6 Ed. VI. c. 11. Comnterfuiting the coin wis formerly treason; lont ly varims statutes, it is prowided that the wite's dower should mot he forfeited, and that the lamds should be forfeited andy for the life of the offender. Forfeiture for treason and felony is accompanied by compupion of bleod, wherely the offender is incaprable of inheriting any lands or of transmitting any title to an heir. But where the lamels were not vested in the offender at the time of the act, they are not forfeiten to the crown, lut to the overlori. In England, this distinction is of little moment, except in enplold lands, the crown leing, in fact, the overlord of narly all the frechold lamel in the kingdom. By 7 Ame, c, 2 , it was enacted that, after the death of the l'retender and his sons, no attainder for treason shoulal operate to the prejuljce of other than the oflender himself; lout this provision was repraded. 39 Geo. III., c. 93. Bhat in scotlaml, where subinfendation still subsists, the distinction is of practical importance. In Southand, before the Union, forfeiture of estate was incurred on account of treason and certain other crimes, as theft by a landed man, and uttering false eoin. Lord Stair is of uminom that the ductrine of corruption of blood died net prevail in seatland to exclude those clamine, throuch a person attainted, where the offember was only apparent heir (Stair, iii. 3. 38). Sinee the Union, the law of Scotland in regard
toforientur for teasem has hern assimilated to that ai 1:1ui.uni.

 a puralty of the foutall law, incurred in acemant of some act hy the thant inferrias dindoyalty to his overlorl. The acts inforing foffeiture might loe of either a ciol on a criminal nature. Forfeiture for crimes was incurred lig treason or felong: Sew
 forfeiture may he incurred in Englabl in three wavs-vik, ly tortious alienation, ly wrongful disclamer, and by alienatun in morthain ; the first two of there moles were inchents of the femblal temure, the latter was introluced by statate. It mont ine observerl that, acomding to the earliest fondal curtoms a eift of hals was always made in favour of a particular persom, amd that alienation. withont consent of the uverlord, involved a forfeitne of the fee. Fint this strictaess having by degrees ceased to be observed, forfeiture was only incurred in case of a tortims alienation. Tortious alienation was where the owner of a particular estate convered by common law ronsevance, as feotment. tine, or recovery a ereater estate than that to which he was limself entited, as where a tenant-for-life made a ientiment in fee. The immediate effect of this act was the forfoiture of the land to the remainder man or reversioner. By 3 and 4 Will. 1V. e. It. aholishing fines and recoveries, and $S$ and 9 Vict. e. 106, s. 4, declaring that a feofment shonlel not have a tortious puration, forfeiture by tortions alienation has ceased to have a practical importance. Forfeature by wrongful dischamer was where a tenant hulling witer a superior lort, on being summoned in any court of reerech either diselams his allegiane. "r does any act which amonts to a disclamers. Sine the aimition. by the statute of queite cmptores. of suhinfoulation, this species of forviture can only arise in lamts held of the crown. Forfeiture by allimation in mortman is incurred by the enusey. ance oi lanls or tements in farom of any coir-
 tompral. As ly restime the hand in a tomant of this deacrigtion. the wermon was deprived of all the dhenes anil serviers due ing his vassal, this act was leclared ly varoms acts of parliament to infer the forfeiture of the lands. Nee Monsmass. Forfeiture of coplahls, was incurred ly committing waste, aml by other acts of a wromeful kind incomistent with the fealty due tu the loma. See liackstune, Come. ii. :24. Forititure on hreach of om lition, subsequint is where an atate is hele upma comblition contained in the frant itself. On failure of the condition, the grantor or hiz bers may enter upon the bamis.

In reathand. civil ferficiture may arise either from

 falline tu bay the ir forduties for two years shall furint their right. This furfeiture must be estah, hanosl ly ath artion to renoce the follutios in arrear. ath may lee avoidmo by payment at the har. At common law, a vassal furfeited his land by dis-
clamation or purpertare 'fhe former is analogous to the Enchah diselamer, and consists in the demal ly a varab of his lan ful supering. I'urpresture was
 hanays in commonties lofonge to the erown or wher superint, These forms of forfeiture are fallen into disuce. Forfeiture on special infement elequals wholly minn the tornse of tha e"mation inserted is the tithes to the land. The combition must be fortitiod by irritant and resolutise clanses, and must anter the sasme in orider that it may le effectmal aramet parhase of the lamk (Erskime ii. 3. s. 15).

 ing renthot iron or steel inta any requirel shape is called Forgias adm the worlshop, in which the "pration is pertoment, a forse. The principal trols of a commom smith's furge are the forge-tire or hoarth, woth its lellows, the iavil, and the various hammors. swages, de. For large work, an airfurnace, bown lye stem-hellow-, supplies the place of the smple hearth of the blackinith, powerinl cranes swiug the work to its place on the anvil, and a steam-hammer (see llammen) strikes the hlows that syueze the red-hot mass into shape. Besiles these, there are portable forges of varions sizes and forms, used for military and other farposes. They usially consist of an inon frame, to which a bellows, worked hy the foot, is attacheri; and above the bellows is an iron tray, with a hearth, \&e., upon when the fire is mate; and the auril is either attached to this frame, or has a selarate stand.

Luler 'rorixy, the general methoul of forging small work is deseritucl. For the largest work to which hani-hammers are still apllied, suh as amehor-forghes two gangs of from six to twelwe hanmermen are emphoyd; they swing the large hammers with such wombertul precision and regularity, that the instant one hammer is withdrawn, another fatls ning the same flace. A foreman, with a wand, drects the hanmering. The two gangs reliese each other alternately, on accomat of the ereat severity of the labmir. shovels, spates, mattocks, ani many uther tomls and implements, are partly forgel wher the tilt-hammer. See Strel.

In all processes of forgma, it is of prinity importance to , ohtain the ereatest possible rapidity in the suretssim of the blows. There is a double reason for this: first, and simply, that the work is cooling and the mare slowly it is forged, the more frequenty it must be re-heated : and secondly, that percussion renerates actual hat, and if the hlows are sufficiontly heary and rapid, the temperature of the work may be fully mantaned ont of the fire for a conviduable lenth of time. The hammer used for thlines steel unt only manains the heat of the bar, but raises it from a dull to a bright red heat.
FORGEIY (Fr. firgr, to fomm metal into shape; to falmieate), the rrimen fithi of the Roman law, is heh in Englam, at common law, to be the framblent making or altering of a writing or seal. to the prejulice of anothor man's right, or of a stamp to the prefudice of the rosenuc. As regaris writings, the instrument forged must he executed with such skill or in such circumstances as to the calualle of heing mistaken for a gemuine document by a persom of ordinary intelligence amb obserration. It is not necessary that there should be evola an attempt at imitation. If there was intentimn to deceive. and the circumstances were such as to remeler feception possible, the crime has been committod. and it has enosepuently been hed in sontland that it is pussible to forge the name
of a person who caunot write ( 1 Alison, 1. 372), and further that the crime may be committed ly the allhilition of a cross or mark Alamillan, January 24, 1859). Any material alteration, however slight, is a forgery just as much as the sulbscription of the aame of the pretended maker, or the falrication of the entire elect. It will not lessen the crime, though the whole deed should be genuine, the name only being forged, or the name boing really the handwriting of the party to whon it belongs, but appended to a forged deed. liven if the name be a fietitions one, hut apmented for the pmpose of deceiving, a forgery has leen committed just as much as if it belouged to a real ferson. Lung hefore the reeent extensions tork phace in the law of evidence, by which parties were admittert as witnesses in their own causes, it was grovided loy 9 geo. 1V. c. 32 , that the party whose name lated heen forged might be a witness to the etlicet that the writing was not his. But, win the wther hand, it is an established rule of law that the proof of forgery, by a mere conpurison of handwriting, is incompetent (Tailur on Evidence, 1 . $1425,11.5,2(\mathrm{ed}$.$) . Ilentification of handwriting is,$ if 1 ossible, more difficult than identitication of the persun, which so often forms the chief ditticulty in criminal trials. 'As illness, strange dress, unusual attitude, and the like, cause mistakes in identifying the individual, so a bad peli, or rough paper, a shaking hanl, hurry, and many other things, change the aprearance of a person's handwriting.'-Dickson on Eridence. 1" 474. There are besiles resemhances in handwritings proceeding from many aecidental causes, so that much eantion is necessary in weighing this kind of evidence. 'It ought never, therefore, to be regarded as full proof by the crown in criminal trials, and even in civil cases, corroborative evidence shonld be required, unless the proof of handwriting is so clear as to shift the onus probandi.' Though writing-masters, engravers, bankers' clerks, and other persons in the habit of examining bandwritings are often adhluced as witnesses in trials for forgery, their evidence is really of very little value, and generally so conllicting that it can be produced with equal effect on cither side. The best witness is one who bas often seen the party write, through whose hands his writing has been continually passing, and whose opinion is not the result of an inspection made on a particular oceasion for a special purpose. The act 11 Geo. I Y., and 1 Will. IV. c. 66, makes the forging of the great seal, the privy seal, or any privy simet, the sign-manual, the seals of sootlani, or the great seal and priyy seal of 1relandtreason. The same statute declares the offence of forging, or uttering with intent to defrank, stampes, exchequer lills, Bank of England notes. bills of exchange, bromissory notes, deeds, receipts, orders for the payment of mones, transfers of stock, wills. \&e, to he felony. C'apital punishment was tirst alonlished with regat to special cases of furgery $1, y$ $\because$ Gco. 1 V', aml 1 Will. IV.e. 66, and 2 aml 3 Wili. IV. c. I23; and then altogether done away with by 7 Will. IV. and 1 Vict. c. St. The oflimier is now lialle to penal servitule, the lencth of which is at the discretion of the conrt ; but whieh cannot he for less than three years, or he may be impisoned for not more than four, or less than two years, with or without hard latoon and solitude. As to the forgery of Bank of England notes, see 16 Vict. c. $\xrightarrow{2}$. As to obtaining property ly false pretences, see Fratd.

FOR(IET-ME-NOT, or SCORPION GIASS (Myosotis), a gemus of annual or biennial herbaccous plants, of the matural order Doraginece, with 5 -cleft calyx and salver-shaped corolla; the
flowers small, and generally blue. The genus is diffinsed over the temperate zone in all quarters of the world, and a number of species are common in Britain, chiefly growing in ditches and danp, meadows-as Myosotis jucustris, with crooked creeping perennial roots-an angular stem of a foot in height, and calyx covered with almessed bristles. M. syleatica, with ealyx covered with stifl spreading hairs, grows in bushy places and woods, and is often 1hanted in Hower-gardens. The dark bue $F$. of the Azures (M. Azorica) has of late begun to be cultivated iu Europe, bat requires the green-house. The genus is a favourite one with mont persons, luth because of the brilliancy of the flowers, and beeause throughout Europe it is generally regarded as the emblem of friendship. The English name soorpinn Grass is now seldon beard. The Cerman name J'ryiszmeimitht corresponds with the English Forget-me-not.-MI. versiculor, very common in Britain, often as a weed in gardeus, is remarkable for the change of colon in the flowers, which are tirst ycllow, then hue. They are very small.-M. alpestris, foumb on some of the mountians of Scotland, is especially admired for the size and brillaney of its ilowers.

FORIO, a thriving town of ltaly, is picturesquely situated on the west coast of the islanil of lschia, which stands at the northern side of the mouth of the Bay of Naples. The central portion of the town consists of very narrow streets, but the suburiss are composed of chamming white cuttages. It has three lighly decorated ehurches, a grool harbour, and some trade with Leghorn, Naples, and Genoa. Pop. 6500.

FORISFAMILIA'TION (literally, the pitting forth from or beyond the family is the spmation of a child from the family of his father. A chind is said to be forisfamiliated, either when he marrios or when be receives from his father a separate stock, the profits of which are enjoyed liy himself, though he may still reside with his father, or when be gues to hive in anotber family with the consent of his father. The same result is also brought athont when a child renounces his legitim, i.e., his legal share of the father's free movable property the to him on the death of the latter. See Bell's Dic. of the Laul of scotland.

FORKS. These table instruments are only almout three centuries old. The Greeks, Romans, and nther ancient nations knew nothing of forks. They has large forks for hay, and also iron forks for taking meat out of pots, but no instruments of the mature of table-forks. In ancient times, as is the practice still in the East, meat was commonly prepared as stews; or if roasted, it was cut intor small pieces liy a carrer, so as to be easily taken in moutbiuls ly the guests, who used their fingers and a knife for the 1 urpose. It certainly is a strange fact, that the use of any species of forks at table was guite unknown till the I5th c., and they were then known only in 1taly, which has the merit of this invention. None of the sovereigus of England Lad forks till after the reign of Henry VInl.; all, high and low, used their fingers. It was aceordingly a part of the ctiquette of the table to employ the fingurs so delicately as not to dirty the hand to any serious degree; but as even by the best management the fingers were less or more soiled, it was the custom to wash the hands immediately on the disbes being removed from the table. Hence, in the royal honseholk, there was a dignitary ealled the Eurrar or Eirary, who with a set of subordinates attended at meals with hasins, water and towels. The office of Ewary survived after forks came partially into use. We learn that when James 1. entertained the

433

 forks had dombtios leen presmed to the graen as foregun curinstans of sman value, the were probe alde neter used at table: As yet, and for a comshleathle time atterwards, forls were not in common use, a emenmastame bess attonhatalde to ighorance of the inventom, than to prejublues. So fir was this mejulsee carmed, by wen equcated persons, that ne divme prachal agninst the use of forks, as ising an insult tol Pronalence not to touch one's oneat wath one's lingers!
1taly, as has Tecta sabi, chaims the merit of this nseful invention. This fact is explicatly learned from an aceobut of a tour in ltaly loy it traveller named thomas conyate, who visited that eomentry in lous. Its travels, styded remblifes, were pulb. lished first in tell, and repuldisheel in 17-6. In these reveltios afpear the following passages respecting the $\{$ talan tewns: " olserved a chatom in all these Italian cities and townes through which I passed, that is mot nsed in any other comotry that I saw in my travels: noither ion 1 thom that any ather mation of Clinistemben duth nee it, lont only Italy. The Italian and also most strangers do always at their muals nase a little forke when they cut thoir mat. Fon while with then knife, whed they hod in une hame they cot the monte ont of the dish, they fantion the ferke, which they hold in their wother hams, munn the same lislo; so that whatsener ho be that sittime in the company of whers at meals, shmblumbinally tomel the dish of meat with his fimgers. trom which all the table floe ent, he will give serasion of offence unto the compays, as hawher thas ressed thon laws of good mamers, in se moth that for his earm lew shall be at the least lorowheaten, if not repmedember in wordes, This form of feedinge I moderstand, is semerally nesed in all places of Italy; ther forks being for the most prut made of yrom, stomet and some of shlucr, hut these are usul ouly hey entlemen. The reason the this emonsty is, beane the ltalian eannot hy any means molire to have his dash toncheal with timers, sering that all men's fincors are not alake clemse. Heranom, I myself thought grom to imitater the Italim fandima ling forkea entting of meate, not coly what I was in Italy, hut alse in
 lome: laing whe anipuad for that irefont using of my forke, hy a coltan learned genteman, a fambar thom of mine, Nr Laturnce Whitaker,

 but fom on "ther canse' The term here employed jerularly, was in its serions meaning one of reproach, haver ferm apphed by the homans to those slaves
whe as a pmishment lore a forked frame or yok (fura), wembling an inverted A-hence the Italim firre and forthelus; the latter (little fork) beines frllowed in the Froneh time furchutte, while the former is the ront of the Emglish word fork.

Comk canne su slowly into use in Finghal, that they wrem employed unty by the higher rlasses at the mindle of the Jith contury. Ahout the perion of the wowntion, fow moblemen han mose than a dozen forks of silver, almug with a frew of iron or storl. At leneth, for pencral use, steel forks lweame an artiche of manniacture at shodicht : at first, they land lat two promes, anl it was only in later times that the thereponed lime were mate. As late as the early part of the ISth c., talabeforks, and we may add linises, wern kept on so meagre a seale by comintry inns in seotland (amb, perhans, also in some farts of Endinul), that it was customary for genthemen in trawding to carry with them a portable lomfe amd fork in a shagreen case; and till this day a small knife and fork form part of the omamental culuipment in the Highand ilress. The ofoneral intruluction of silver forks into Great loritain is quite recent; it can be dated no further back than the opening of the continent to English tomists at the termination of the French war in 1814. The extensive use of these costly instruments in the present day, marks in an extraodinary dearee the raphel prodiess of wealth and refined taste throughout the United Kinghom.
FORLI, an interesting city of Italy, capital of the mevince of the same name, is beantifully situated at the font of the Almonines, in a pleasant and fertile plain, on the right lank of the Montone, 16 miles somth-west of havemma. It is a well-built, handsome city, is surcomed with walls, aml contains many striking specimons of architecture, of wheh the Cherini labazo, lmult after the ilesigus of Nichacd Angelo, the lalazo Commale, the Monte di lbetia, the cathedral, a majestie bmidine, ami the churehes of s . Jhitipo Neri, of S. (iirolamo, and of S , Neremiale, are the most untable. The ecclesiastical Imilelings of F. contain sume of the leest pictures of Cignam, Carlo Maratti, Cumbo, ame other masters. The citalch, fombed in 1361 , is now used as a prison. Top. 16, 043 , who carry on silk-spinming and saltretibing. with a considialale trate in corn, liuen, hemp, carthamus, wanl, \&e. F. (the ancient Forum Lidii) is saill to have been foumded by Mareas Livius Salmation, after his victory over IIashrubal, on the Dletaurns, on $^{-}$f.c., anil to have received its name from lim. In the midulde ages, it formed a repmbic, and exchanged its rulers frequently during the struseles of the Guelphs and Ghibellines. In 1503, it was amexed to the States of the Church, and so fomaineal till 1860, when it was placet with the Aimblian provinces under the sepptre of Victor Emmanuel.

Forlorin-hope, the body of men selected to attompt a breach, or to leal in saaling the wall of a fortress. The name (which in the french, enfants perlus, is even more expressive) is given on account of the extreme danger to which the leaters of a storming-party are necessarily exposel. As, however, the honomr of success is promerionate to the peril of the mudertaking, there is ordinarily no lack of volmuteers for this ardums service. The forlornhope is called by the Germans Die verlornen I'osten.

FORMA PAU'PERIS, the phrase usually employed both in England and Scotland to signify the arrangements ly which an netion may be carried m lay one who is tho por to sue in the ordinary way. In England, the statutes 11 Henry Vil. c. le, and 2: Henry VIII. c. 15, prowide that such as will swear themselves not worth $£ 5$ except their

## FORMATFON-FORMS OF ADDRESS

wearing apparel and the matter in question in the cause, shall be exempt when plaintiff, lat not when defundants, from the payment of court-fees, ant shall he entitled to have counsel and attorney assigned to them by the court without fee. They are further exensel from eosts when unsueressful: B privilege which, aceording to Blackstone, amounted in former times only to the rather nucomfortable alternative of choosing loctwed paying and being whippet. In the event of success, however, a fursm sumy in this form is entitled to his costs, buanse his comsel and acent, aml the officers of conrt, thongh they are bount to give their lakour gratis to him, are not bomil to give it un the same turms ter lus antagonist, unless he too lre a paluer. To prevent the atuse of suing in tho superior conts at 1 Westminster in this fom in matters of small ammat, it is provided ( 19 and 20 Vtict. c. I0s, s. Bol, subject to certain exceptrons, that any plaintiff whe resints to one of these, in a case falling within the consmance of a county eourt. and reavers no more than $t^{\prime 2} 0$, or in some cases $t 5$, shall have no cont. muless he satisties the court or a judese that he had sufficient reason for taking that conrse. There ave some other excoptions to the rule (see Stephen's C'om iii. [. 64ti).
in scouthon, this benerolent arrangement was intronluced los statute more than half a century before the date of the Endish act we have nom tionech. In 1424, the statute (c. H5), which we have alrealy quoted under Aclsocate (I. v.), was passed For the purpose of securing professional assistanco gratis, to the poor, and for givine to them and those who assisted them their ensts in the event of sucuess. The more succial arrangenents applicable to litemtion in this form in Scotland will be detailed under P'uor's lioll (q. v.).

FORMATION, in Geology, is applied to a group of strata united by some character which they have in emmon, whether of aget origin, or compusition, as the coal or chalk formation.

FORMEDON, an old form of action, in the Law of England, wherely an heir of entail on rumainder man who had leen ousted ly a diseontimance. was entitled to vimatiate his clam to the lands from which he hal been masted. Ly 21 James 1 . c. 1f, it was enacted that writ of formelon shond be brought within twenty years of the time when the callse of action arose. Writ of formedon is now abolished, together with other real actions.

Fu'linll ACHD ( $\left.\mathrm{C}_{2} \mathrm{HO}_{3}, \mathrm{HO}\right)$ derives its name from the circumstance of its havins leeen first obtained from the Pormica rufu, or red ant. In a concentrated state, it is a fuming liguor with an irritating odour, atud occasions vesication if dronperl ujon the skin. It erystallises at a temperature below $32^{\circ}$, and loils at akout $212^{\circ}$, yelaing a sapour which burns with a blue flame. It is a strong redueing agent, at a boiling temperature relucing the salts of silver, mercury, platimum, and gold.

It may be oltatined in various ways, as, forexample: I. ly the distillation of red ants with water (a proceeding never adopted now). 2. Iby the distilla. tion of a mixture of starch, binoxide of manganese, sulphurie aeid, and water ; this is the usual method. and rarions organic matters, as sugar, chafi, bran. saw-dust, \&e., may be substituted for the starch. 3. liy the distillation of oxalic acill mixed with sand, or far better (according to Berthelot), with glycerine: I equivalent of oxalic acid ( $\mathrm{C}_{4} \mathrm{O}_{5}, 2 \mathrm{HO}$ ) yieldins 1 equivalent of formic acil $\left(\mathrm{C}_{2} \mathrm{HO}_{3}, \mathrm{HO}\right)+2$ erfuivalents of carbonic acid ( $-\mathrm{CO}_{2}$ ).

Bertholot has recently oltained it synthetically ly keeping carbonic oxide gas for a prolonged period in contact with hydrate of potash, at a temperature
of 212 . The gas luonmes gradually alosorled, and formate of potish is the result, the reaction being exhithited by the formula, I equivalent of hydrats of lutas $h_{1}$ ( $\left.\mathrm{KO}, 110 \mathrm{O}\right)+2$ equivalents of carlomic xile (ev() $=1$ equivalent of formate of fotash (Кい, (12)

Fommic aeld is a very common froluct of the oxitation of organic budies; thas, fur examole, the allmminates, glycine, sugar, stareh. \&e., yiehl it in association with other promett, when actel on by chromic acid; the fats and fatty acids yield it when acted un by nitrie acid; and it is a maluet of the action of ozone on glycerine, fats, fatty salts, aeetic acil, and sugar, provided a frue alkali is present. Hence, we can reabily explain its ocomrence as a promut of oxilation in the animal organism, in whin it not mefreruently occurs, either free or in combination. Thms we find it not only in ants, hout in the 1 uisnn of the lree ant wasp, and in the hairs of the procession eaterpillar: It las been detected ly varions chmists in the sweat, in the expressel juice of the spleen, pancras, thymus glank, and maseles, in the braik, the bloon, and the urine.

The salts of formic acil, which are termen by some chemists formates, and ly uthers fommates. remine nu special montice. They" are all somble, and siell a red coluner with persalts of iron.

## formíca. See Ant.

FORMINCis IsLAND is a speck on the hosom of the lacific, lying a little to the north of the Sandwich Grould, or Hawainan Archipelayo, in lat. $30^{\prime} 49^{\prime}$ N., aud long. I59 $29^{\prime} \mathrm{W}$. It is one of the most recent additions to the British cmpire, having lieen formally oceupied, mainly on acconut of its cxecllent harbour, tusards the close of 1560 .

FORMO'SA (Chinese name. Tai-nan), a large island on the sunth-east coast of China, oplnsite the province of Fr-keen, from which it is distant ahont 90 miles. It lics hetween $21^{5} 583-9$ I6 N. Lat., and 120 $15^{\prime}-122^{\circ} 4^{\prime}$ E. long. ; and for almini. strative purgoses, is included in the province lufore mentioned, of which (tosether with Ping-low grould) it forms a department. The length of F., from north to sonth, is ahont 237 miles. amd its average hrealth. from east to west, is abomt 70 miles. A chain of mountains runneng morth and someth nearly bisects the island, and diviles it into an eantern and western jrusince. Chinese settlers oceupy the latter, hut the other section is hold lyy the aborigines. Tai-wan (q.v.), the eapital, in ot N. 子at., and on the western coast, was openel to foreign commere ly the treaty of Tien-tsin, Jume 26, Isis. F. has a fertile soil, anl produces rice, maize, sugar, tobaceo, cimnamon, puper, \&c. ; oranges, pine-aphes, guavas, coena-nuts, ${ }^{\text {n m megramates, as well as grapes, peaches, }}$ and ather European fruits, are abundant. The aboriginal inhabitants are still in a very rule state.
FOLADS OF ADDIEESS. Many fersms are exposel to inconvenience from their igorance of the finmal modes of ahdessing letters to persons of title; we shall therufure, in the present article. give an enumeration, taken mainly from Mr Iod's Peprate and litronage of the disual ceremonious mothes of written adkess. I'revious to their employment, the writer must, of eourse, learn either from the peerage-writers, or from some other source, the frecise rank of the gerson whom he wishes to adhlues. as well as the hereditary, personal, or official tustinctions by which that rank is often monlitiod.

Scotch hishun's are ahdressed 'The bishup of -..., some-
 Trerot)", and letters commence, " Sight Jieveread wir:' 'The colmal bishops are aldressed by their territoral tithes, like thase of Englami.

Jinhops: Writes and Children have no titles.
Countess - The Right Honouralile the Comntess if - ? Letters emmence, 'Nalam,' and refer to her as ' Your ladyship.'

Huchess-'Mer Grace the Ducless of -..' Let. th's commence, 'Madam,' and refer to her as 'Your Curace.'

Duke 'JIs Giace the Duke of ——..' Letters commence, 'Hy Lord Duke;' and be is referred to as 'Sour Cirace.'

Dute's Danghtor- 'The Right Ilonomalile Lady Mary ——,' or less furmally, "The hady dary --.' leetters commence, 'Madam, and refer to har as "Your Ladyship." If she is martied to a person of inform rank, her surname only is changed.
Whlis's Eltest sion-l'ses the second or some other title of his family ley countosy, and he is atderessed as if lee hodt the title loy law, though in formal ducuments he is called - Esy., commonly culled the Marpuis or Earl' (as the case may lee).

Dukt's Youmge son- The Dishit Jomomable
 Shn It -.' 'My Lord,' and ' Four' Lordship.'
 mulus whore she las a title in her own right. - Hmham,' and ' Your Lady ship.'

Cond The lifint Immorable the Earl of -a, of less formally, 'The land of ? M Dome, ann - 'our Lamishiq.'

liates lildost som is ahtressen as if the title which he lolds in cometesy were at title in law:

 wife, mbers of superime ramk to her hashand.

Kin:-"ilic King's Muat Lxcellent Maje-ty."
'Sirr, :anl 'Your Majesty ; or, in less formal notes, thms: - Mr l'ill Iresents his duty to Jom Majesty:'
A゙ume Bachlor-Like baronct (q. v.), except that the woml 'Part.' is maitted.
Knigh Lathetor's Hefe-like Baronet's Wife (1. $\begin{gathered}1 \\ \text { ) }\end{gathered}$
 we wher tithe of the bearer.
linight of st l'utide-N.l'. used in the same manner.

Knitht of the Thistle-K.T.
hivight of the buth—if a knight Grame Cross,

Kindht of the Bath's Wije-Like the wife of a Faronet or Kinight Paclowhes.

Lord Alewocate' (of scotlard)- 'The Jiight IIonourable the Lord Adverate' ly courtesy; lint in official Ancuments he is styled 'JIer Majesty's Alvocate for Scotland.' Letters onght strictly to commenee, 'Sir,' not ' My Lorll,' thongla the latter mode of address is the more usmal.
Lowl Licttenant (of Melem()-'1lis Excellency the Lord Lientenant; and letters commence in aecordance with his rank in the perrage or otherwise. If a duke, he is styled 'His (irace the Lord Licntenant.'
Lorl Muror-' The Right IIonomable the Lord
 are only three Lord Mayors-those of London, York, and Dullim.

Lond Prorost - The Srowost of Elinburgh is "The Mirlat Honouralite the Lurd Prowost;' of Glasgow, 'The Honourable the Jom Provost;' of Jerth and of . Aberileen, "The Lord 'rovost.' There are no other Lord Provosts. Perhaps the distinction in the title of the ehief magistrate of the Scottish capital is traceable to his having been always a member of the Privy Council of Scotland, Irom at least the period of the Revolution.
Lord of Session (in Scotland)-'The Honoturable Lond -.'. 'My Lord,' and 'Your Lerdship.'

Lurts of /Ier Majesty's Treastry-l'hese in their collective capacity are addressed as "The Ilonom" able the Lords Commissioners of Mer Majesty's Treasury;' individually they have no title from their connection with the Treasury.

Mhitl of Honour - The Honomrable Miss;' and 'Mantam.'
Murchioness-'The Most Jononrable the Marchimess of -. 'Madam,' and ' Your Ladyship',
Iferquis-"The Most Jonourable the Marquis of - , not - The Must Noble.' Letters commence ' 3y Lord Marquis;' but when personally addressed, he is styled 'My lond,' and 'Tour Lordshin.'

Murquis's Duughter-Like Duke's Daughter (q. r.).
Murquis's Eldest Son-Like Duke's Eldest Son (1. 5).

Minapuis's Jounyer Son, like Duke's Younger Som (1. 3.).
lhugors-In formal documents, 'The Sight Worshipful the Dlayor - -;' bnt in letters, simply 'The Mivyor.'
it mbers of Partionnen-The letters M.P. are aded to their usual adrlatss.
affers in the Vory and Army-Their rank in the sorvice is always prefixel to any othor title they may pussess, thins : 'Captain the Lorl John -- ?' Prince-'JI is Foyal Itighess Prince-_' or 'Ilis lioyal Highness the Duke of --,' when the Prince is also a buke. In practice, the initials II.IA.II. are nsually substituted for the words. A leitur berins 'Sir,' not 'My Lord Joke;' and tho mate of reference is "Your Thoal Highess.'

I'vinecss-'Jler layal Highness the Priacess --,', "r 'The Duchess' (as the case may be). 'Madam,' and 'Yur Ioyval llighmess.'

Prince's Jife, though of inferior rank, like a 'rumishment of the samin.' 'fhis aet, which was Princess by birth.

Privy C'ouncillor-'The Right Honourable John
Privy Councillor's Hige and rhildren have no title.

QCeen-'The Queen's Most Exechent Majesty.' 'Madam, and 'Yeur Majesty;' or, 'The Lord John li-_... presents his duty to your Mlajesty.
riecount-"The Right Honomable Lord Viscount - -, or Iess formally, 'The Lord Viscount.' 'My Lriel,' and 'Your Lordship.'

「"iscountess - 'The Right Honmurable the Viscountess,' or less formally, "The Viscountess.' 'Mantom,' and ' Your Ladyship.'
liscmunt's Dunghter, like Barm's Daughter (q. r.).
Friscount's Son, like Baron's s'm (q. r.).
J'iscuant's S'on's H'ife, like Baron's Son's Wife (q. r.).

Thu formality of these modes of address experiences considerable modifications when employed ly persons of equal rank. Between fricnols and relatives, they are either entirely disjensen with (exeept, of course, in addressing letters), ur adaptod to the fcelings and caprices of the writers. In this, as in many other respects, we of the present generation are far less ceremonions than our fathers, and still wore than our grandathers were. In most old letters, it will he fonnd that the titles of the writers are preserved even where there is the frecst and nust familiar interehange of thought and feeling. Wives address their husbauds, and husbands their wives, chilhren their parents, and oceasionally cven parents their 'hildren, as 'Sir' or 'Matam,' My Lord,' or 'Your Royal Highness,' as the case may he.

## FOFAS OF PROCEDURE. Sce Proress.

FORNICA'TION (furmicutio, from fornio, an arch-vault, and liy metonymy, a brothel, heause brothels at Rome were in cellars and vaults under ground). In most countries, this crime has been brought within the pale of positive law at some periond of their history, and prohibited by the imposition of pemalties more or less severe; tut it has always been found ultimately to be more expedient to trust to the restraints which pullie opinion impose on it im every commonty which is gnided ly the principles of morality and religion. In England, in 1650, during the ascendency of the Puritan party, the repeated act of kecping a brothel or committing fornication was mate felony without benclit of clergy on a secont cunsiction. At the Restoration, when the crime of hypocrisy seemed for a time to be the only one which, under the influences of a very natural reaction, men wore willing to recognise, this enactment was not renewed; and though notorious and open lewdoess, when carried to the extent of exciting public scandal, continued, as it bad been before, an indictahle offence at eommon law, the mere act of fornication itself was abandoned to the feelle cocreion of the spinitual court, acenrding to the rales of the eanon law, a law whith has treatel the offence of incontinence with a great deal of temderness and lenity, owing perliaps to the constramed celihacy of its first compilers.' - Blackstone. The procedings of the spiritual cutut wore regulated ly 27 Geo. 111. e. 44, whieh cuacts that the suit must be instituted within cight months, and that it camot be maintained at all after the marriage of the parties offending. Put proceedings in the eeclesiastical courts for this aflence have now fallen into entire desuetule (Stephen's Com. iv. 347). In Scotland, shortly after the Reformation, fornication was prolibited by what Baron Hume calls 'an anxions statute of James VI' (1567 c. I3), entitled 'Anent the Filthie Vice of Fornication, and
passed in the same farlianent by which incest and adultery are punished with death, proviles that the offender, whethor male or female, shall pay for the first oflence a fine of $\pm 40$ Scots, and shall stand barcheaded, and fastened at the market-place, for the space of two hours; for the seeond, shall pay a fine of 100 merks, have the head shaven, and shall be exposed in the same public manner ; and for the third, pay a fine of $£ 100$, be thrice ducked in the foulest prol of the parish, and be banished the town or parish for ever. There is but one instance of this statute having been enforeed ly the C'urt of Justieiary, which oecurs, as might he supposed, during the govermment of the Protector in Scotland. The offenee of kecping a house of noturious ill-fame and seandalising the ariyhbourhood, is punshable in Scotland as a police offence. Sce Nuisavice and Prostitution.

FORRES, a royal burgh in the county of Elgin or Moray, situated on a wril-marked ohd sea-terrace and promontory, distant about twomiles from the mouth of the river Findhom (f.v.). Poll. (1861) 350 . It was a royal hurch in the reign of lines David I. (112t-1103), and was suksequently the seat of the Archateacon of Noray, who had as his prebend the church of Forres, dedieated to St Laurence the martyr, and the church of Logynfy thenach (now Edinkillic), dedieated to St John the baptist. A painting of st Laurense holding in his hand the gridion on which he is said to have leeen roastel, is preserved at Brodie House near Forres. The antiquities of the place are the remains of its eastle, at the west end of the town, now surmounted by a monument, crected to the memory of Dr 'Thomson (a native of Cromarty, distinguished ly his eminent medical services in the Crimean war), and the remarkalle senfptured pillar- 25 feet high-sometimes ealled Sueno's Stone, bat more commonly 'the Stan'in' Stane,' which stands alwont a mile to the eastward. A momastery of black friars is said to bave stood formerly on the site now occupied by Anderson's or the Forres Academical Institution. F. Iiss at the foot of a curiously formed gronj of four gravelly hills, named the Clmy or Oleeny Hills, evidently water-made, on the highest of which, the site of an old encampment, an oetagonal tower 66 feet high, was erected to the memory of Nelson in 1806. (1571-pop. 3950.)

FORSTER, Joms, an English prilitical and historical writer. was born at Neweastle in 1812. He was educated for the bar, hut early, like so many other law students, devoted himself to periodieal writing. In this sphere of literature he displayed more than usual alility; and his political artieles in the Loncton Examiner, for which he commenced writing in 1534, attracted more attention than is usually bestowed on newspaper leaders. There was a vigour and point ahout tlem, compded with a truth, consistency, and outspoken honesty (the three latter qualities being more rare in hewspaper writers a quanter of a century ago than they are now), which obtained a wide renown for the paper. F becanse cditur of the Esominer in 1S46, an offee which he still discharges. He is the author of many admirable biographical and historical essays, and we are indebted to him for much new and valuable information tonding to clneidate obseure points, and correet erroneous notions about the times and statesmen of the English Commonwealth. It is to this period of history that $F$. has chiefly direeted his studies, and no persou lesirons of properly understanding it, should neglect his Hintory of the Cirand liemonstrunce, Arrest of the Five Members, and Lives of the stutesmen of the

Folister, Tonaxi Georg Adas, crmmonly
 Forster (1. \%.), a fierman traveller and naturalist, was hom at Nassemhum, bear Danzis, in 1754, and dial at laris in 1794, When only 17 years of age he accombanel his father in Captain Cook's second royag: and shontly after his return, he puldishon, with the assistance of his father, an acenunt of the expelition. His book, which does not eliffer matomatly in its facts from Cuok's narrative, was well received by the puhlic, and was trambatel into French, Germad, Swedish, and other languanes. Humbolit speaks of this work and of its buthor, 'my celelrated tewher amb frieml, Cinsrge Forster,' in the highest terms in the Consmos (see wol. ii. pran, Buhn's al.). F. lawing returnil to the continent, was made Prufessur of Natural llistery at Cossel, and afterwarls at Wiha. Having there maceess to \}omks, in 1788 he gladly acespora the othee of librarian to the Electin of

Mavace. After Nawence was taken by the lirumh in 1 :an, 1 ․, whin hal beesme an ardent repmblean, was sent is a deputy to l'aris, to request the ibomeWratinn of Naycure with the French repuldic. Whike he was in l'aris on this mission, the l'rassaters rotws Mayence, and F. lost all his properts, indming his lonks and manuscrigits. He then writes to a frieml: - If I could only scrape together E4n, 1 would learn Persian and Aralice and wo wirland to India to gather new expericace: 'lot athnt this time he seems to have lne nufferins from rhommatic gout, which gradually inereased in serority, ant which terminated lis life on the 1 ath of ommary 179t. Besides numerous translations, amb the acemnt of Captain Cook's boyare, lis mont impertant works are Kleine Schrigin, ,in
 schichte und Plilosophie des Letren ( 6 vols., Burim. 1759-1797), and Ansichten rom Niolerrhein, wan lirahat, Flundern. Molland. E'mgland, and Franko reich (3 vols., berlin, 1791-1794). His widow, the daugher of Ilcine, Int perhaps more widely kumen as Therese Hulner, published a collection of his Letters, in $\because$ vols., in 18:8-18299 and a complete adition of his works, in 9 vols., was published by his dunghter and Gervinus, in 1843.

Forster, Thomas Igsatics Maria, an Englikh meteorologist and physieist, horn in London in 1789, and died in 1850. In 1812, he catered the universty of Cambridge; in the following year, he produced an amnotated cdition of Aratus, and in 1816 he editell an edition of Catullus. In 1517 , he pmbished Giservations on the Intuence of Porficular situtes of the Atmosilure on IIuman Healthe wiml 1) isenss ; in 150.4 , The Peremion Culendar: in 1507, The Pocket Enneycloportia of Nutural Phomomont: a work which has elieited the commendation of Quetelet abel Ilumbohat; in 18.3n, Obsercalions.s sur ilmpuence des C'omites; and in 1850. Ammetes d'an Physicien Ioyugeur. A work entitled Ejpindurinm Forstriomum, consisting of a collection of ormanal letters from emineat men, preservel in the Forster family, was $1^{\text {mblished after his death, at Drussels, }}$ in 1852.

POLT, a term of peculiar meaning in British North Amorica, applice to a trating lowst in the wilderness with reference to its indispensable dufences, however slight, ayainst the surrombluy larharism. It has thus been oftem amployed to disignate merely a palisaded lor-hut, the central oasis of civilisation in a desent larger, it may be, than Scotlanc.

FORT, FORTRESS (from Lat. fortis, strong), a stronghoh, made secure ly walls, and generally further protected by a ditch and larapet. For the cunstruction of furts, see Fortificatios.

FORT ADJUTANT, an officer holling an appointment in a furtress-where the garrism is ofton compused of drafts from different corpsanalogous to that of aljutant in a regiment. He is risumsible to the commandant for the internal diselpline, and the alpropriation of the mecessiry datics to particular corjs. Fort aljatants, of whan thure are at present ( 1562 ) ten, ire staff-uficers, aml receive $4 s$. $9 d$. a day in addition to their regimental 1 ay.

FolRT AUGUSTUS, a villate at the south end of Lorli Ness, 99 miles sonth-west of lnverness. A fort, intended to overawe the llighliams, was built here sum after the rebellion of 1715 , on a small cminate on the loch. It can accomomate 300 men, but is commanded hy meighoming heights. It was taken by the releels in 1745 , and become the houl-puarters of the lake of comberland after the battle of culloden. It is a ymabrangle, with

## FORT GEORGE-FOITTI.

a bastion at each of the four comers. The twelve six-pounders formerly mounted here have been renoved, but a few soldiers are generally stationed at the furt.

NORT © EORGE, a fortification in the north-east of Invernuss-shire, on a low sanily projection into the Muray Firth, hare only one mile broad, oplosite Fortrose, and nine miles north-east of Inverness. It is the most complete fort in the kingilom, and was built, at a cust of $\boldsymbol{x}^{6} 160,000$, soon after the rebellion ,f 1745, to keep the IIighlanelers in sulpjection. It covers twelve acres, and can accommotate 0000 men. It is an irrecudar polygon, with six bastions, and upwards of 70 gans. It is defended by a ditel, covert-way, a glaeis, two imettes, and a ravelin. It has casenated cmotains, 07 bomb-pronf ronns, hombproof magazines, and is supplied with water from eirlit jump-wells. It is, however, only secme from attack by sea.

## FOl:T GEORGE (INDIA). Sce Minmal.

FOliT MAJOR, the mext officer to the govemor or commandant in a fortress. IIe is expected to, unkerstand the theory of its defences and works, and is repionsible that the walls are at all times duly protected. He is on the staff, and receives 9.\% id. a day in addition to his half-pay:

FOIT I:OYAL, a fortified sezport of the French islaml of Tartinique, in the $W^{-}$est Indies, is the capital of the colony. It stands on the wost cuast, in a lay of its own mame, in lat. $14^{\circ}$ By N゙, and long. $61^{\circ} 4^{\prime} \mathrm{W}$. It has a 1 mpulation of abont 12,0000 , aud contains olbees for the lucal govermment, barracks, arsenal, and hospital.

FORT ST DAVID, on the Coromandel or east coast of Hindustan, belongs to the bistrict of somet Arcot and presidency of Jadras. It is three miles to the morth of Cuddalore, and 100 to the sonth of Stadras, in lat. $11^{\circ} 45^{\prime} \mathrm{K} .$, and long. $79^{\circ} 50^{\prime} \mathrm{L}$. The flace lecame British in l691. It occupiel a prominent prosition in the great strugerle for supremacy between England and France. From 174t to 1758, it was the capital of the settlements of the former power on the Carnatic; lut sonn afterwards, its fortitications having been demolished, it sank into comparative insignificance.

FOR'T WILLIdM, a village in Inverness-shire, near the west lase of Ben Nevis, 63 miles southwest rif Inverness, and at the south end of the C'alodonian Canal. i fort was originally bult bere liy General Monk, and afterwarls relinitt on a smaller scale by DVilliam III. It is an irresular work, with ditch, glacis, ravelin, bomb-proof magazine, and harracks for 100 men. It resisted sity 10 es by the Hidhlanders in 1715 and 17.55 . It was onc of the ohl keys to the West Highlame, aml is now only inferior to Oban as a centre for tomrists to explore these romantic regions.

FORT W1LLIAM (Indin). See Calctita.
Forreé, in Music, the Italian term for loud; fortissimo, as lond as possible.

FORTESCUE, SIR JoHs, an eminent judge ant writer on English law, descended from a Deronshire family, was the son of Sir Henry Furtescue, Lord Chief-justice of Ireland, ant was born some time in the rejun of Henry IV. Educated at Fxeter Coliege, Oxford, he was called to the bar at Lincaln's lon, and in lifl was made serjeant-at-law. The following year, he was appointed Lord Chief-justice of the Court of King's Deach. In the struggle for the crown between the Houses of York and lancaster, be steadily adhered to the latter, and is supposed to have been for a time Lord Migh Chancellor of England. Lord Camplell, in his Lives of the Lord Chancellors (rol. i. 1. 367), under date February 17, 1461, says:
'If Sir John Fortescue ever was do fucto cbancellor, and in the exercisc of the dutios of the oflice, it must have been now, after the second battle of St Albans, and at the very conclusion of the reign of Henry VI.' In March of that year, he fonght at the battle of Towton for that monareb, and was attainted by the parliament umler Edward IV. He accompanied the queen, Margaret of Anjon, and her young son, Prince Elwarl, on their Hight into Sootlanil, and while there wrote a treatise in supprot of the clam of the 1louse of Lancaster to the English crown. In 1463, ho embarked with the quecn and her son for Ilolland, where he remaineal for several fears, intrusted with the education of the young prince. Duriny his exile, he wrote his celebrated work, De Lauldbus Lfyum Angliar, for the instruetion of his royal pupil. In the intrialuction, and thronghont the dialogue, he desiornates himself "Cancellarius.' It was when he was in Scotland that the title of Chancellor of England is said by sume to have been conferred upon him by the dethroned monarch. He probibly had the titular ufice of chancellor in portibus during his exile, but never exurcised the functions in Enoland. In 1471, be returned with Queen Margaret and her son ; but on the final defeat of the Lineistrian party at the battle of 'lewkestury, where he is said to have boen taken prisumer, fiuding that parkanent and the nation had reengmised the title of Elward 15., he subruitted to that monareh, aml, as a eondition of his pardon, wrote a treatise in favour of the elaim of the Jonse of York. He was allowed to retire to his seat of Ebrington, in Gloneestershire, where he died in his 90th year. His male representative was, in 1750, ereated Earl Fortesene and Viscount Lbrington in the peerage of Great Eritain.

FOIPTH, a river of scotland, rises in the north. west of Stirlingshire, in the mountains between Loch Katrine abal Loch Lomond, from two main lranches, the Duchray, 16 miles long, from the east side of Ben Lamond, and the Avendlu, 12 miles long, flowing through Lochs Chon, Uhu, ant Ard. T"hese streams unite at Aberfoyle, and issue from tho mountains. The $F$. then runs east and south-east along the borders of Perth and stirling shires, with munerous wintings, in a wide valley abounding in licturesque scentry. It passes Stirling and a little above Alloa it wilens ont into the Firth of Forth. The F. is only 30 mikes long in a straight line from its source to the month of the Devon; but, owing to its simmosities, its real course is more than twice that length. It is navigalble for vessels of 100 tons to Stirling. Its chief tributaries are the Teith, the Allan, and the Devon. The aruer parts of the $\mathbf{F}$. aud Teith traverse some of the most romantic lake and mountain seenery in Scutlaad.

FORTH, Frrtir of, an arm of the sea, or the estuary of the river Furth, lits between the counties of Clackmannan, Perth, and Fife on the north, and those of Stirling, Linlithgow, Edinburgh, and IIad. dington on the south. It first extends 6 miles south-east from where the Devon joins the Forth; then, with an average breaulth of $2!$ miles, it ruas 10 miles to Qneensferry; and finally, it extends 36 miles north-east, gradually expanding in width to 15 miles betwen Fife-ness and Tantallon Castle on the coast of Haddingtonshire. Its waters are from 7 to 30 fathoms dee 1 , and encircle the Isle of May, Bass lock, Inchkeith, Inchcolm, Cramond Isle, \&e. On the coast, are many fine harbours. St Margaret's Hope, above Queensferry, is one of the safest road. steals in the kingdon. The chief rivers whieh fall into the firth are the Forth, Carron, Avon, Almond, Esk, and Leven. The countics along its shore are the most fertile and best cultivated in Scotlaml, and include the maritime towns of North Berwick,

 ar then lay whel an arrestment is mate avalalle to the arreter. The arrestment secures the groche or hhlis in the ham?s of the creditur or homber bey tha forthemaing the arrostee and common delotion

In fortifying a phace, the engineer usmally proeeds upu semine idfined system of entomage; hut if he hone for success. his selence must be suthajently dastie to adapt itself to all the matural features of the locality and from this it follows that a system perfect in theory and of miversal aplication, will in practice hare to undergo moditications, dillering in ahost every instance.

The wrigin of the art is involved in an olscurity which histury neted not hope to penctrate. The carliest reconts of all nations speak of walled cities anil forts.

The prime chment of all fortification is the parapert (trom Italian perce, betore; petto, the beast), which may lee a wooden stockade, a wall of masomy: or a monid of earth, and is intembed to give more or less cover to the defenter from the projectiles of his adversury, white be is still able to ase his own weanus arainst the latter. The simplest form of parapet heing the momel of earth, the ground adjuining it would probably be dug up for its formation, and from this womll almost unconscionsly enstu the ditch, as an alditional means of separating the assadint and the assailed. Starting, then, from this parapet and ditch or fosse, as the chmentary forms of defence, it will le well, before proceeding to describe the ancient and modern systems, to give concise matical detinitions of the parts, adjuncts, and techmical names of a fortifieation.

The first duty of a defender is to prewent, as far as possible, the encmy's near aproach to any of his works. In derndred systema, this is songht to, be done by hastims, \&e. (of which hereafter), which stami lint at andes tis the general line, so as to allind a fire commanliner all parts. but as cases ateasimatly happen of troons, defended by a mere straght parapet and ditch, having to withstand the advane of tha comy, it is necessary to adopet every measure which can uhstrnct his path, harass his whance, am, if lusible, aid in cutting off his retreat in the erent of failure:

Ahattis (q. v.) are among the simplest onstacles to bu improvisul, comsisting of trees cut hown, shom If thein leaves and smaller twins, havine their
 whe in more lines parallel to the works, branches ontwarrl, and trums imbedded or pinned down in
the earth. . decontred troms mast remove these lof fome they can fass, and the ondation of rownsal muler tire from the lessieged is at very serious one imberd.
 tion) are panter irom or worden ronds fixed crosswisu in a woulen bem, and until removed ofloring a complete ulosta le to progress. They are very usemb in at brach or ather nollosed 1 mition of a work, amd are mow made in pieces, su as tu lee partable, and yet roaly for immediate patting tosethor. A cheval-let-frise is usually 1 ? feet long, with a beam Stinches spuare.
(humsise-trupes, or Coltrons (1. ri), give serious annsyance to trong alvancing, and are espectally dagurans in cases of night-attack. Their use was, howerer, mare general fomerly than it is now.

Trous-diclorio (walforas), which are dee b hokes dug, and armed at the lotom with spikes, young trees cut down and their stmmps pintel, inverted harrows, broken sword-harks, biyonets, oir any similar anoyances, are resorted to as expedients to gain time, and thereby insure a more leally fire on the assailints. They are frequently constructed in the glacis of a work.

Frotises and Stuckerles represent anothre form of aditional defence, and are stont posts driven horio zontally or perpeadicularly into the earth, in long

Fig. 1.-Fraise and Stockade (in section):
AB, parapet ; C, escarp: D, frase; Le, stockide; F, glacis; G, dutch ; II, counterscarp.
close rows. Fig. I shews the use of both these hefences in the ditch of a fortress, and it will be perceived at once how formidahle to an attacking party solid lines of these posts must be. The stockade forms lakewise, at times, a gool sulustitute for the paranet itsolf, particularly when the direct tire of artillery is malikely to be bronght against it, as in warfare with harbarous tribes, or in a work at the very crest of a stecp, hill. In this case it is usually eomstructed of two rows of strong palisades firmly imbeddel in the cround : the outer nearly a foot square, jlanted with three-inch intervals between; the secom abont six inches in diameter, closing these spaces behind. Every second small palisade is cut

Fig. a-stockade.

Fig. 3.-Double Stockade.
shont a fow inches, so as to leave a loophole for musketry tire (as in fig. 2). A hill protected in this minner is shewn in fig. 3 .

## FORTIFICATION.

fortion of ground behind it, its leight must be calculatel so that missiles passing across its crest shall fail tu strike the troops mustered behind. The minimum with defiladel to allow of safe commonication for troops behind, and actnally defending, is 30 feet; lont if the men have to be drawn up in line, not less than 90 feet will suffice. The mode of ascurtaining the height of parapet necessary in particnlar cases will lue seen from the next diagram (fis. 4). Let A be the position at which the parapet is to be made, and AB the space which

Fig. 4.
it is required to defilate to a height throughout equal tol $\mathrm{BC}, \mathrm{D}, \mathrm{H}_{1}, \mathrm{D}_{2}$, are three points, aeeneling to the supposed conntry romil, from which fire conk he hat at the parapet-one, I, beins on the level, the others on ground respectively higher and lower than the parapet: if lines be now drawn from these points to $\mathbb{C}$, their intersection with a perpenticular, raised on the point $A$, will shew the elevation necessary for the parapet protecting the space $A B$ to the height BU. From this, the disalvantage will be aprarent of constructing a parapet within range of hygher grounch as for every extra foot of elevation in the commandiug rise a propertionate aldition must he made to the lieight of the parapet. ln practice, the ordinary parapet for a level is eight feet high, which allows for the depressed trajectory of a spemiing ball. See l'rouectiles. If the parapet te raisel on groum above the attacking pusition, it may be lowered, according to the angle, to about six feet six inches, the height necessary for a man standing up to he thoroughly protectet. On the other hand, if the bosition, A, be lower than the point occupied ly the assailant, the parapet must le raiset ; as 12 feet forms the limit to which a parapet can conveniently le thrown up, further height necessary for protection is obtained by sinking the gromal to be deliladed lefore the parapet's base. In measuring for these heights, the instruments used are boningrocls, which are tixel in the ground at $D$ and $B$, with the normal height of a man marked on them; a thind rol at $A$ is then marked at the point where the line of sight between the normal points on the two others intersects it, and so shews the leight of the parapet.

The fureguing parapet has been provided only as a straight breastwork, deriving its safity solely from its own fire in a direct line upon the besiegers; but in practice such a rampart wnuld be exposed to the disadrantage of holding but little command over the scempor excerp (part cut away) at its foot; so that, if approched under coser, in enemy conhl reatily lodre himself therein. To guard against this a work is flumed, so that the fire of one part shall take in flank an enemy atsancing argainst another part. See fig. 5, where ABCDE is a tlanked or recimocally lefensive parapet, in which it is evident that the fire from AB, DE, must take in flank any foree moving on BC or CD, while the latter also, in like manner, thank AB, DE, themselves. In a flanked defence of this sort, the angles, A, C, E, which project towards the country, are technically termed salient angles; those at B anil D , re-entering angles. The thanked parapet has often, likewise, the fower of elefilating larger spaces than the simple line of
parapet, since the salient angles can, perhaps, be hrount on clevater] ground; while the re-entering angles, thongh with less elevation, may in some

Tegree compensate that defect by greater distance from the front. A disadvantage of thanked defences is, that the hustile fire closses the jarapet at a less angle than in the straight line, and maty, therefore, be more deadly; inteed, the object of the assailant will always be to obtain an entilade fire along one or more parapets of the defence, as (in fis. 5) an enemy prosted at F , wonh be able to sweep the complete line of the parapet CB . To avin this, the engineer who efmstruets the works must ascertain minntely the clevation of the surrounting points, and make his salients at such anyles that the prolongation of his parapets towards the enemy shall always fall on low grumbl, whene no command can be obtained.

Now, where the salient ange beermes sumewhat acute. and there is an enemy wh loth fronts, the soldiers defending the right parajet, and stavding on its lanquette, would le exposed to a reverse or back fire from the enemy in front of the left parapet, beyonl the tefilaliay of which they wond donbtless be. As a remedy, an internal jarapet, called a traererse, "rr, from its cluty, a pumelos, is raised letween the jarapets of the salient, its holyt being determined on precisely the same principles as were make use of in regard to the original parapets.

Where both the faces of the salient are mavoinably so placed as to be enfilarled, a small work, calleel a lomat, is constructed at the angle, which consists in the parapet being so raised up, to an extra heisht of twelve feet if necessary, and at the saure time widenel, that the banquette shath le defintet. It a beight of twelve feet is insufficient to defilank: the whole lemgth of the hanquette, traversing parajets must be raised at right angles to the face of the work, and within it, at such distances that the Whole may be safe: of course, the height of the honnct anl of the traverses must be thecitet on rules analogrus tu those exItained in fig. 4. The increaseal heiglet of the parapet of the bonnet renders it necessary to have two or mure lanquettes

Fic. E.-Eumnet. at that purtion of the work, with steps to ait the ascent (see sectiom in tig. 6) ; as Als, the crest of the general parapet, with loanduette at $\mathrm{C}_{\text {: }}$ and DE, the bonnet, with lampuettes at $F$ and $G$.

Tn encluset works-i.e., in works entirely surrumulel by jarupets-the position of the paratos is of yital importance; ant they have often to be desised with great ingenuity, so as to protect the defenders from reverse fire in any direction, and at the same time not to prevent necessary eommunication butween different purtions of the fortress.
lieliof means the Leight of any point in a work almve the plane of construction, whieh may be the line of sight or the bettom of the diteh. In the latter case, the relief of the parapet is an important

Ite-11 in costanaton? the resisting lower of it work, as it repursent- the butical iynublent of the shostache wheh wall tee ofliored to io face.

When the rewne of the parapet's crest has been a letertumed, its thickinss heocomas the next connshatratmo. 'The dumensoms are latal down on the combul, and depelmi, first, wh the anghe at whicle the fanteral to lee nsed will bile; ame then, on the
nature of the missiles against whiel the paranot is to aflond protection. For example, an earthwork of from three to fom leet sulfices to resist muskety; a thockness of 15 feet is impervions to the 24 -pomblex; whold larger gans can pound through even more solial olostrinetions.
'raking lige 7 as an example, in which $a$ is the crest of the farapet, then the banquette $e$ shoukl,

Fig. T.-Section of Parapet, Ditch, ant Ciacis.
for convenient firing, be four foet three incles below az; its will three foct, if for in single line of solders ; forr tect six inclues for a donhle ramk ; its slope shondel he ome in twolve, that water may run frouly ofl. 'The base, be, of the slope, up which the mon mount to the hanquette, shomlal F. twice its hoight be, and cut intu steps with indineil sidus, to allow of easy ascent; and where the heient is comsubrable, a supplementil banquette (on which mehevinomen cin, if necessary. relowit, is esimale. The interine slope, ac, of tha parapet should be ane in four; the exterior
 the mans on an assalant, one in six, a deviation hems permitted botween one in nine and one in four ; but the erest being more lialie to destruction as the sope of "hb is angmentel, it is bost to lery it as small as circumstances will allow ; one in six is the urlinary slope in English fortification, the ande of the interior slope bejner constant. In some continnatal survices, however, the ancre, cal, is kept constant at $100^{\circ}$, by inereasing the deviation of the interior slope of the parapet from the perpendicular as the planere of the exterior is greater. The flatter, howrove, the crest of the parapet is the better, as samd-bars are in certain cases ranged on it to form cover for the men, while they fire thromgh lonpholes luft in this ahditional defeuce. Earth of metimn tuacity manatans its pasition properly when slopend at an anfe of $45^{\circ}$; and this is the greatest angle which ean the colintad on for the outer slope of the barapet 'The scarp, $l$, and eounterscarp, $m$, of the fitch med not have so qreat an moline, as thet frommet in which they are ent has usually had time, arm the foutstups of ages, to consolidate it. In snch cases, the hase of the triangle is frequently marle aqual ter half the perpendicular. Cases, of course, wecur in which stecerer banks are eonsidered indislumsatile; and then, to prevent slips, the earth must have a roating to keep it ujp, which may be of fascines, humbles, planks, or sand-bans, for temporary works, ur thase constrmeted in the midst of action; while the nows solad masonry performs the same function in fortresses of a move permanent nature. This ontor contines is clenominaterl a reveltment.

In tiop 7 , yhi, is that glacis, formerl durinis the "xemsation of the ditch, and having for object the lirimeiner of an alvancmif enemy into the best line of fire from the prapet. The Irise and perpendicular if its intermo slope, gh, shomal be equal; the slope of 17. whtor fice shomilil be one in twelve, unless the slope of the gramind remeler some different angle hesimable. An alvamed glacis, $k$ in fig. 7 , is sometames adopteal, in order that the enemy may the smaner be bromeght undir tire. It is alisolutely menessury that the erest of the parapet shonhal be dive and is laalf foet higher than the erest of the
macis, as, otherwis', an assailant having reacled the latter, wonll be able to pour a masketry-lire over the former into the work. No part of any glacis, whether near or adranced, shoult be more than two foct helow the line of fire from the parapeti.e., the line joining the erests of the parapet and glacis continued; if more depth be allowed, the (namy may alvance in a crouching posture, without boing liable to be hit. Adranced glaeis are usually malte of earth thrown up in prolonging beneath the grommi the plane of the preceding glacis. They may be defembed entirely from the paramet, in Which case palisales or abattis are often fixed (as in fig. 7) to delay the advaneing enemy when at the pinint of greatest exposure. On the other hand, these alvinucul glaeis are uccasionally defemed as it series of advanced intrencbments, and only atrandoned, one ly onc, as the defenders are driven in towarls their main work.

The himensions of the ditch depend in some measure on the anount of earth required for the prarapet and glacis ; but in addition to being the mine whence the materials for the latter works are drawn, the diteh must also oppose a considerable otrstacle to any hostile adrance. To do this collectually, the minimm wilth aeross the top is Is fect; its depth need only be limited lyy the troulle of raising the earth; but in pactice 12 fret is fomm the gratest which can be conveniently arrived at. 1 laving ascertained the profile of the parapet, with its bauquette or bauquettes, bonmets, traverses, glacis, \&c., it becomes a mere matter of mensuration to eompute the area of a section, to multiply it loy the length, and so to obtain the cubje feet of earth required. With the length of the ditch known, a very simple calculation then exhilits its width and denth-a small allowance luing made for the fact that the earth, dug out from the litch, where it has probably been long compressed, will acenpy somewhat more space when thrown 11 , and brolien into elorls, for forming the parapet.
'llat scorp, or inner face of the diteh, is most diflicult of aseent by the assailant, when in a contimnous line with the parapet (as in fig. 7) ; but sometimes it would be dangerous to eonstruct the work with this continuity, as damage to the scarp woull jeoparlise the stibility of the parapet. In these cases a narrow step, called a Berm (c, v.) of from two to four fect, is made to intervene lectween the foot of the paripet and top of the scarp: as a precaution, it is covered with all possible obstacles tu any loigment being effected on it by the enemy. When a bern is employed, greater stepuess is usually riven to the searp.
'lle counterserp, or suter sloping side of the diteh, shombl be somewhat sterper than the searp.

## FORTIFICATION

The hottom of the ditch shomld slope from both sides towards the centre, to carry off the water; and obstacles should he scattered about to prevent an enemy from forming his troops in the ditch.

Earthworis in Field Fortification.-As the most readily constructerl, earthworks naturally recommend themselves to the encincer, who, in the fielal, is called upon to defend the position of an army against sudden attack. Their ntility has been shewn in their employment from the earliest times; and modern experience temls to prove that earth-parapets are of all fortifications among the most difficult to overcome. In army manouvring before a supwrior force, can scarcely hope to avoid battle beiny thrust upen it, muless, strengthened by fiellworks, it be remdered more nearly equal to the adversary. Napoleon, Marlborough, Engene, Wellington, have given their names as witnesses to the indispensability of such works. The Rassian parapets at Borodioo male the lirench victory so samgliwary a triumple that it was useless to the victors. A few redoults at Pultowa savel Peter the dreat from tutal defoat by his formidalle swedish rival. The world-famer lines of Torres Vedras emabled Wellinaton with 50,000 troops, half of whom were untried l'ortugnese, to withstand for five months, and ultimately to drive back, the hitherto victorions army of 70,000 Erench, under such commanters as Masséna, Ney, and Junot. The earthworks surronmting Sevastopol partvok greatly of the nature of tidlaworks for the protection of a large amy, and history will not forget to remont the resistance they utfered for almost a year to the best trous of the civilised world.

For a line, whether of eath or masonry, to be efficient, it must combine artillery fire with that of musketry. The guns will generally be so placed as to command some specitic line of approach, such as a ravise, a line of abattis, or some portion of the glacis. They shouk themsclves be as little exposed as possible, nor shonld the gnoners be nocovered mere than is absolutely requisite. To eflect this, the gun is generally made to fire through an pmbrasure ( $(\mathrm{g} . \mathrm{v}$.$) ) in the parapet, instead of aver the latter.$ The embrasure is a cutting through the solid parapet, 20 inches wide at its inner extrenity, and outwards half as much as the wilth of the parapet. lu cases where it is necessary, fir froper command, that the line of fire should not be lower than the top of the parapet, the embrasure is made through an aditional parapet-raised, as in the previous case of the bonnet, above the original one. The buttum of the embrasure is called the sole, and slopes downward sufficiently to allow of a certain alepression beins given to the gun. The remainter of is parapet below the sole is the grouillere (from sprou, a knee), and in ficlel fortification shonle be three and a half feet hich; the protion between two embrasmes is the mirlin (1tal. merlone, battlement); and an cmbrasure newl not cut the parapet perrendiendarly, an angle being almissible, when in obligue fire is necessary. When, however, the obliquity woul. exceed $70^{\circ}$, it is usual, in oruler that the thickness of the iarapet should net be too much diminished, to form a project. ing angle in it, through which the embrasure is cut (as in tig. 8). The sides of the embrasures are cleseks, and require revêting.

A burbette is a plationm raised behind a parapet,
higher than the general interior, with a vicw to glus being fired from it over the parapet.

There are certain tixed rules in all fortification, such as:-I. The length of lines must never execed musketry range, or the flanking-works would become ineflective for their olject. -. The angles of defence should be about right angles. 3. Galient angles shoule be as obtuse as possible. 4. Ditches slumhl have the best possitble flanking. 5 . The relief of the thanking-worlis must be determinel hy the length of the lines of defence. 6. The value of almost every detached work depents on the support it can give to or receive from an army or other work or works. 7. The reduction of every fortifien work is merely a question of time; and a work fairly surranded is sure to fall, muless relieved from withont.

Fiehtwerks, which, it must be borne in mind, are intented merely to support or strengthen an amy, may either have a complete circuit of 1 arapets, or may be opra at the gorge in the rear. The latter are, of course, the simplest; but they are only available in 1 ositions which the enemy camnot turn, wr where arotected by the sweepins fire of uther works behind. Of this class the Redem, a more salient angle (see fig. (1),

Fis. ! 1 -liectan. is the simplest am the repre- sentative form. Uf the clused forts, there are Renloults, ustably square; stur-furtu, now considerel whectionable; bastioned forts, as in tig. 10, which Hank their own ditches almost perfectly, while scarcely susceptilile of leing tlanked themselves. To uaderstand the uature of a single bastion, see A (tig. 10), which represents one at the comer of a stuare work; $a b$ is the left Jlank, be the left fuce, cd the right fuce, de the right flent: a a is the gorge: af, fe are the demi-yoryes, licius continuations of the

Nine foet drav are allowed romal tha traberses on the cowert-way ; at the re-entering angles of the covert-way. Hacis uf armes are formed ly settimg of 30 vards our each side, amb with this as enore, alvancing frees inclined to each other at $100^{\circ}$. If the polyton had how a square, of would have been $\frac{1}{6}$ ab; if a pentagn, $\frac{2}{3}$ wh: and fur any polygon of more siles thath sewen, $\frac{1}{6}$ efl.
"Cublurl's swould and thind systems were those in which be adaptad ohl walls to heis mokern impowements. Availing himeli of the works alroady formed, la abled countergards in front of the cormerenwers, thereby making hulluw bastimss, and aromber the necessity of entirely remilhine.
Coblomin's syntem had connterguands in front of the hanturas and parallel to them. The flanked

 theroby reducing the logeth of the linstion face avahathe fur bronehing from without. He also revived the step-hke formation of the cowered waty orizinally seen in sueckle in the botlo c., ind which gives difenders a contimued line of fire from cach fravise along the covert-way.

The" muntion anstom differs bint little from that of Commontigne. The reventering phaces of arms have cirenber fronts instead of augular; the angle of the racelin is tiver at 60 , and all the lest $p^{\text {minats of }}$ ohlur stybes are assmeiated.
Fige lis is momed to pesent at one view a rearesentation of the systems in furce sine artillery camp intes conmom nse, as well as the sramual transtion form sumare towers on enotle walls to thakeal bastions on modern hees. 'THe eloments of fortifying aymanst shapheg will be fomb moker Manise Finitheathes; the primeiples of attacking fortresses generally, under Siegi, and NoNE, Nhasams.

Fol'fititerrd. Nionlo, an Italian poet, was inorn at l'stenja. Nowember 7, l6it. Inestimen from youth for the charch, he procected to liome at an tarly perind, where the power of the prelate farlo A. Fabmai, who was his relative, specelily seemed han alraneennent, and where he was ultimately raisen to the dicnity of prelater and papal chanberlain loy Clmont $\mathcal{X} l$, An ardent cultivator and prateector of lettors, it must be owned that F'sum "mankitions are more prized for a cotatin rich joviality of imitary, and profuse faciloty of lumater, than for any siblingt beanty of style or concopition, His chief work, Il ficciendeto, was miginally eombenced in confutation of friemeds, who maintaned
that the striking ease and fluency of Arinsto. throni, and other juets of a similar sehool, were land apment, am in reality the fruit of tleep art and sovere lahmor. F.. in a for homes threw of an entire canto "f $/ /$ Ricciardetlo, strikingly in imit.atimb of the almue juts, and cimimuol the work at tambum moh beyonel its origimally designed limits. It was pahlishen in 170 en, two years after his teath. and mat with merniweal favor, notwithotanding the invedible incidents and lientions imanes with

Folithosbe or Forthoss, a parlimmentary and soyal hargh, seaport, and wat ring place in the atst of Ross-shire, on the west sile of the Moray Futh, opposite Furt George ten miles momberthand of luserness. Pofs. (15, 1)911. It unites with Inverness, Forres, and Nam in sending a member tu parliament. $F$, had as time eathadral and a hishups matice: but hoth of these lomblings were partially destroyed muder Cromwell, anl the stones sent to inverness, to le nsed in huidine a fort there. It has a good trade in various kinds of produce, as pork, erges, all sorts of grain, and potatocs. In the lith e., f. had a considcrable trade, and is said to have been the seat of arts, seimee, and divinity in the north of sootland. Chanomry, with which it was unitenl in 144, was formerly the see of the histopis of hoss.

FORTS ANE FORTALICES. The military power of the state is intrusted by the constitution of this country to the sovercign. After having heen unconstitutionally claimed Ly the Long larliament in the time of Charles I., it was again vimatieated for the crown by 2 Car. II. c. 6. This branch of the royal promgative extends not only to the raising of arimies and the construction of Hects, hut to the lailitiner of forts and other places of strength. Sir Ehward ('oke lays it down (1 I hot. in), that no subjecet can lmilh a house of strength embattled without the licence of the king; and it was cuacted by 11 lhary V11. e. 18, that no such place of strength could be coureyed without a special grant.
FolatU'NA, called ly the Greeks, Tyche was in classical mytholny the ©oduless of Clance. Aceording to Hesim, she was a daughter of Weams ; acorting to Pimdar, a sister of the I'ares. She difked from Destiny or Fate, in so far that sle workel withont law, giving or taking away at her own grod pleasure, and dispensing joy or surrow inhiferently. She had temples at Smyma, Cominth, am klis. In Italy, she was extensively worshiphel from a very carly perion : amd hal many names, such as Putricin, Plobech, Equestris, I"bilis, Primigonia, Publica, Prirata, Muliolivis, Virginensis, Se, innliating the extent and also the minuteness of her superintemlence. Particular honours were paid to la $\begin{aligned} \\ \text { at Antimm and Dreneste ; in the temple of the }\end{aligned}$ former city, two statnes of her were eren consulted as oracles, Greck poets and sculptors genorally represented her with a rudder, as a symbel of her ghiding power : or with a hall, or wheel, or wings, as a symbll of her matability. The Tomans montly aflimed that when she entered their city, she the wo away her globe, and put ofll her wings and shoos, to indicate that she mant to dwell with them for ever.

FolltuNATUS is the title of one of the best mondes books (Folkshicher) wer witten. It origitatmalamat the milate of the 15the, though many of the tales and legends inchuted in it are of murh ohder date. 'The opinion that it was worked up into (iorman from a Spanish or English orimal may be considered as set aside. The substance of the book is that Fo, and his sous after him, are the
possessors of an inexhanstible purse of gold and a wishing-cap, which however, in the end, prove the cause of their ruin. The moral is, that worldy prosperity alone is insufficient to produce lasting happiness. The oldest printed edition of the book now extant bears the date Frankint am Maine, 1500. Later Gemman editions mostly bear the title, Fortunatus, von Stinem sickil und Wunsch-hütlein (Fortunatus: Story of his Purse and Wishing-cap. Anysl. 1530 ; Niirnb. 16:3 ; and Basel, 16999. It has twen reprintcd in Simrock's Deutsche Volkslüchor (3 vols., Frankt. am Maine, 1S46). Various French versions of the German story have alpearel from time to time, as the Mistoire de Fortunatus (liouen, 1670); which served as the grominwork of the Italian Acpmimenti de Fortunatus e elr' Suoi Figli (Names, 16:6). From the German uricinal, have also spmens, among others, the Watch version Een Nivuce Ifistorie with Fortunatus Lorse en ran Zignen J'mach hood (Amst. 179G) ; later, the English Mistory of Fortunctus and his Trwo Sons (Londm, no date); the Danish Fortunati Juing of ünskitut (Kolen. 1664, 10:2, 1695, 1756, 1753) ; the Swedish Fortunatus (1694); ant about l690, two Icelandic versions, one in verse and another in prose. The first to dramatise the sulbject was Hans Sachs, in his Der Firtinnatros mit dem Wrumechsectel (1553), after whom comes the Linglish Thomas Decker with his Pleament Comedie of Ohl Forthmetus (16(0), it work which hat the honour to make its reappearance in Cierman about the year 1620. The most petical edition of the story is that given by Tieck in his Phamtusus (3 vols., Berlin, 1816). See Grisse's Die Sagenkreise des Mitteldters (Urusil. and Leip. 1St2), and Ersch and Gruber's Eucyclopuedie (first sect., vol. 46).

FORTUNE-TELLER. Under the elesimation Vagabonds, in the Scottish Act 1579 c. 74 , are included all who go abent pretending to foretell fortunes. The punishment inflicter on them by the statute is scourging and burning on the car.

FO'RUA1, a Latin worl, which originally simmified an 'open llace,' and is Irohally comnected with foras, 'out-of-doors.' The Roman foro were glaces where the markets and courts of justice were held. The former were termed fore vomalio, and the latter fora judiminha. Of the fora judiciulio, the most ancient and celebrated was the furum liomonorum, or, par excollence, the formm mannum, occupying the quarter now known as the campo vaccino for cattlemarket). It strctehel from the foot of the Capitoline Hill, where the arch of Septimins Severns stands, to the temple of the Diosenri, was seven jutpra in extent, an was surromded ly streets and houses. The boundary on the east and north was the Sucru via, of which the sile norarest the formm was loft open; white on the other were enrrilors and halls, such as thuse of the arymaria (bankers or moneychangers). At a later periol, the site of these was, for the most part, occupid ly basilicas and temples. In the eastern portion of this space. were held the earliest Comitia (ๆ.v.) of the lhmans-the comitio curita; hence this part took the mame of the comitium, and was distinguishel from the forum strietly so called. Here were hung ajp for the lenetit of the public the laws of the Twelve Tahles: and, after 304 E. c., the Fasti written on white talles to inform the citizens when the law-courts were ogen. The Forum, in the narrower usage of the word, probally ceasul to be employed as a market-place about 472 B. c., when it became the place of assemlly of the Cumitia Tributa. Of the later fora venalia, the principal were the formm boarium (the cattle-market), the forum suarium (pig-market), piscatorium (fishmarket), olitorium (vegetable-market), \&c. Public
banquets for the pupmace, ant the cmmots of the ghaliaturs, were, in the time of the republic, usually held in the ereat furum, which also contained monmments of varions kinds, of which may le mentional the famons columue liostrata of C . Inilime, erected in mumpy of his victnry wer the Carthaminns. The rostra, ur platforms from which phblic urations were !elivered, formed the boundary hetwen the formm in its nammer usage and the comitium. After the time of Julius 'exsar amb Augustus, the Formm lomanorum lost the importance it had previonsly derived from heing the central print of laman whitical life. The other two forc judirialus were the Fontm, Iulii and the Forma Augusti. Compare Parkir, Ifonelbudh der Rom. Alterthumer (] rol., leeipsie, ] ti:3).

FORUM COMPETENS, in Law , is the come to the jurisdiction of which the party is amenalile.

Foscari, Fraseesco, Doge of Tenice from 1423 to $145 \%$, a brillinat pervod of compuest and fonsprity to his comtry, and of unexampled aftiction to himself and family. Barn about 13:0, his aspiring ambition som fired him with gassionate eagerness to exalt his reinn liy the glory of conghest, and spedly involved the state in a severe contict with the Dukes of Dilan: which, bow: ever, the cloge's great military ability in the eml turned into a source of glory and aqgrandisment to Venice. II is triump was embittered by the succossive loss of three suns; and the one who remained to transmit the name, and suceed to the inheritance of the family, was, in $1+4.5$, denombed for having receivel bribis from the hostile generals, to use his influence with the doge in procuring less rigurous terms. Tried for this grave crime beture the Tributnal of the Ten, and racked cruclly in view of his father, Ciacopus Foscari was banished for hife, under pain of death should he attemit to revisit his mative laml. In 1451, the assassination of one of the - C'omeil of Ten,' Hermolion Dinati, was imputed, on what seem moret minfomderi gromels, to (riacono, who was consequently smmmoned from his exile, triecl, tortured, and bimished is scombl time on still more rigurous terms to the island of Canlia. Grown reckless thround suffermg, and lomging to see his home and country on any terms, Giatopo petitioneal the Duke of Milian to intercerle in his behalf with the senate, a step which, ty Venctian law, was punisherl as a hinh crime, and led to the miforthuate Giacon, being for the third time subjected to torture and renewed hanishment, on entering into which he diex of griff. The doge hat vainly hosulght permission to resign a dignity grown loathsome to him, from its imposing the barbaruus obligation of witnessing his son's torture; but in the end he was depused, and ordered to vacate the palace in three days At the age of 87 , decrepit from years, and bowed by sorrow and hamiliation, Franceseo $\mathrm{F}_{\text {. }}$ supmorted ly his venerable brother, descendel the Cibat's staircase, and passed ont for cver from the ducal palace, the seene of such wain pomp aml bitter misery: I'asqual Malapheri was chected in his sted in 1457, and at the tirst peal of the bells in honour of has devation, F. expired from the rupture of a hond-vessel. Byron has written a tragedy on the sulject, entitled The Tho Fosceri.

FO'SCOLO, IGo, an Italian anthor, was born about 177 s , at Zante, one of the lonian isles, and proceeded to Venice in his lith year, where for a time he pursued his studies, repairing later to Padua to enjoy Melchiore Cesarotti's noble course of elassie literature. His earliest efforts at poetical comprosition were strictly molelled on his favourite Greck classics; and, as early as 1797 , his tragedy, 417

I'OnislL (Lart. fussilis, day ont of the eanth),
a term formerly aypled, in aceordance with its aberibation, to whatever was dus out of the carth, whother mineral ar organic, lat mow restrieten tas the remanes of plants and animals imbedded in the wartl's crust. They were fommerly, and are sututimes still, called pretrifactions. 'Tluey oceur in nearly' all the seratified rocks, which have, on this acenunt, luen called loussiliferoms stratic. It is difficult or impussible tar detect tleen in the metamorphic rocks, for the chonges that altered the matrix have also allected the orqamisma, so as either almest or altogother to ofliterate them. In the fumbamental moci-schist and gbers they have escaped motice, if eror they existed; amd it is only within the last fow years that their presence has been dotected in the gutiss and uther rocks. which are the greatly netamorphosed representatives of the Lower Silu. rian Measures in the morth of seotland.

The conditions in which fossils oceur are very various. In some Pleistocene beds the organie romains are bont slighty altered, and are spoken of as sub-fussil. In this state are the sbells in some raised sea-leaches, and the remains of the luge struthous hirds of Few Zealand, which still rotain a large portion of the animal basis. In the progress of fossilisation, every trace of animal sulastance disaprears: and if we find the borly at this stage, withont being affected by any other change, it is frapile and friable, like some of the shells in the Londun clay. Most frequently, howeser, a petrify. ing intiltration oceupies the cavities left in the fossil by the disapparance of the animal matter, and it then hecomes hardened and soliditied. Sometimes the whole organism is dissolved and carried of by water preolating the rock, and its former presence is indieated ly the mould of its onter surfice, and the cast of its inner in the locky matrix, leasing a carity between the cast and the mould ayrecing wh the size of the fossil. This earity is occasionally filled up with calcareons spar, thint, or some other mineral; and we thons olotain the form of the "rymism, with the markings of the outer and immer surfaces l, not exhihiting the internal strueture. The most adranced and perfect combtion of fossilisatim is that in which not only the external form, but also the most mimute and complieated intermal organisation is retained; in which the organism loses the whole of its constituents, particle by particle, aml as each little molecule is remosed, its place is taken hy a little molecnle of another substance, as silica or iron prites. In this way we find calcareous comals perfectly preserved in tlint. and trees exhibithur m their siheified or ealcitien stems all the dotals of their microsenic structure-the cells, spiral ressels, or disc-lnearing tissme, as well as the nednllary rays and rings of growth.
fossill FERNS. As far as has leen yet leterminal from the rocky tahlets of the carth's erust, ferus first appeared in the Devonian periml, hut then only sparingly, not more than num or ten species having been observed. In the immediately succeeding ('ond-mensures, they sudetenly reached their maximum development. The lonse forests and the monst atmasphere of this ferind were so suited to thoir gronth that they formed a large lomlk of the vequtation. Lpwards uf 3in specios have been described, some of thom true ferns of a size titting thom to ber the companions of the immense Sigillarias and Lepinodendrons whose remains are found assuctated with theirs in the Carboniferons rocks. Twnoty-three specjes have bean found in lermian stanta. Many new forms appear in the Trias, and their number is increased in the (bolife. The fresh-water beyls of this period contain numerons lowatiful ferns, buwards of tifty species having been l.scribed. The marine beds of the Cretaceous

## FOSSILIFEROLS ROCKS－FOLCHÉ．

period contain very few forms，and in the Tertiary rocks they are equally rare．

FOSsILI＇FEROUS IOOCKS are those which contain oremic remains．If we except the lowest metimorphis rocks，in which，as yet，no fossils have been found，the term is equivalent to the ＇stratified rocks，＇when used comprehensively；lint it may also be ajplied to a particular bed，as when we speak of an unfossilifernus sandstone compared with the neighbonring fossiliferous slale or lime－ stome．

FORSOMBRONE，a small episcural town of Italy，in the province of 1 rhinn and lesaro，is pleasantly situated on a hill on the left hank of the Mrtaum－which is here spanned ly a fine modern bridse－II miles east of the town of［Trbuns．It rose in the 1 th c．，from the ruins of forwm Sem－ promia，distroyed by the doths and Iombards．Sume intrusting Jioman inseriptions and romains of the anciont city are contancel in the cathedral of st Aldohramlo．$F$ ．is celobrated for its fine manufac． tures of carpets and woollen cloths，and particularly for the excellent silk of its noighlourhoor．Three miles from F．is 11 Nonte d＇Aselmbale，famous as the secue of the engagement in which the Cartha－ cinian gencral was eleteated and killed by the
 e Pianta di Fosssombron．

FOSTER，Jomざ，a well－known English essayist， was born in the parish of Ilalifax，lorkshire，Shep－ tember 17，1770．He was chucatol for the ministry at the Japtist College at Bristol，but after preach－ ing for several years to various small congregations with very indifferent success，he resolval to derote himself mainly to literature．His Essays，in a Serifs of Letters，were published in 1805 ，while be was officiating as pastor of a liaptist chapel at Frome，in Somersctshire．They were only four in number－On a Nan＇s Writing Jemoirs of Himself： On Ihecision of Character；On the Applieation of the Epithet Romantic：and On some of the Canses by whiel Ewangelical Religion has been rendered luss acceptable to Persons of C＇ultivated Taste；yet Sir James Maekintosh did not hesitate to atfirm that they slewed their author to be＇one of the most profonnt and eloquent writers that England las producel．＇They have bew remarkably jopu－ lar，especially among the more thourhtful of the commmity，and have gone throuerh upwards of tweaty wlitions． $\ln 1505,5$ married the lady to whom his essays were oricinally arldressed，and rotires to Fourtron－on－the－Water，in Gloucestershire， whare le lived a quiet，studious，literary life， preachins，however，in the villages rame？about on Sumdiys．$l_{n} 1819$ appeared his eelebrated Essoy on the Euvils of Pomultro Ifmorunce，in whicls he urges the necessity of a natimal system of edu－ eation．He was long the prineipal writer in the Lidretic Rovien，aud a selection from his contribu－ tions to that magazine was pulslishod by Ir l＇rice in Isty．He dicd at stapelton，near Sristri，Oetober $1 . \overline{5}$ I $9.4 ;$ ．F．was a man of deep hut sombre picty． ＇Fhe shatows that overhung his sonl were，however， those of an inborn melancholy，and had nothing in eommon with the relulsive glom of bigotry or fanaticism．His thinking is rugreet，massive，and original ；and at times，when his great imagination ronses itself from sleep，a splemdour of illustration loreaks over his pages that startles the reader hoth by its Jeauty and its suggestiveness．Besicles the works alrealy mentioned，$F$ ．publishod several otlers，of wlich the most important is an Ambro ductory lissoy to Doddrilge＇s Rise and Progress of lieligion（1825）．Compare the Life and Corres－ pondence of F．（2 vols．IS 16），caited by J．E．Fiyland，

## and republished in Buhn＇s Standard Library in 1852.

FO＇TIIERGILL PROCESS．This is one of the numerous dry processes in Photugraphy（q．r．） whinh have for their oljeet the preservation of sensitive plates realy for expusure．lt is named artol the inventor，and consiats in the partial removal rif the free nitrate of silver which adberes to the collonlion film on withurawine it from the sensitisines lath ly washing with water，amel the suluseracnt conversion of the remaining free nitrate of silfer into albuminate and chlorible of silver by bouring over the blate dilute allomen，containing chlorile uf ammonium，the excess of allmmen being finally washed oll ly violent astitation with a copions supply of water．The plates beine set aside to drain on folds of blottingepaper，are，when dry， remiy for use．For details of manipulation，see Hardwich＇s Ihotoyraphic Chemistry．

FOITCIIE，Josepin，Duke of Otranto，the son of a Sea－ciptain，was born it Nimes，29th May lice， and wheated at the Oratoire．He hailed the Rebolution with enthusiasm，and in 1 万n：liecame a member of the National Convention．Jee roted for the eleath of Lonis MVI，and was one of the com－ missioners of the Committee of l＇ublic safety sent to lyon in 1794 to reduce that city to obedience． ln 1705 ，he was expelled from the Conventiou as a diangerous Terrorist，and kept in confinement for a short time．After the revolution of the ］Sth Crumaire（．5th November 1799），in which he took a part，F．，as minister of police（an＂ffice to which he hal bren aprointal on the 31st July of the same year），orsanised an extraorlinary police．He restrained the new government from deeds of violence，and by his advice the list of emigres was closed，a general amnesty proclaimed，and the prin－ ciple of moderation and conciliation steadily adhered tio．Iis remark upon the exeention of the Duke 1＇Enghion was very haply＇：＂C＇cat him pis qu＇un crime，c＇est une foute＇（It is much worse than a crime ； it is a blunder）．In July 1804，he was arain placed at the liead of the police．His chicf endeavours were directed，as before，to attaching the royalists to the imperial throne by pradent morleration．In 1809 ， the Emperor conferred on him the title of Duke of Otranto，along with large grants from the revenues of the Neapolitan territory：An ungmardend expres－ sion，bowever，in a Iroclamation，lost him the fivoux of Napoleon，and in the following year he was forcel to resign．In the campaign of 1813 ，the Emperor summoned 1 ．to head－cuarters at Dresden， and sent him the vee as governor of the Illyrian 1rovinces，ambl，aftor the battle of Leipsic，to liome aum Naples，in order to keep a wateh ！pon Murat＇s procectings．Buing recalled to Paris in the spring of 1814 ，he predicted the downfall of Napoleon even lefure his arrival in France．After the Emperur＇s abdication，F＊adriserl him to ahandon Europo altosether．Un his return from Eibr，Siajuleon again nowinated lim minister of police；but after the battle of Waterloo，F．placel hinself at the bead of the provisional govermment，bronght about the capitulation of Paris，drew back the army behind the Loire，and therely prevented unneces－ sary bloodshed．At the Restoration，Louis XVJU． reappointed him minister of police；fut he resigned his office in a few months，and went as amhassador to Dresilen．The law of the lath January 1816， hanishing all those who had voted for the death of Louis XV1．，was extended to 1 ．also，who from that time resided in different parts of Austria． He died at Trieste， 26 th December 1420，leaving an immense fortune．Napolerm，at st llelena，called F．＇a miscreant of all colours；＇and Dourrienne

rot camise a handsome town of France, in the doparthent of llhe-ct-Tilaine, stands un a hiill on the rifht lank of the Conesmon, $4=5$ miles nurth-east of Rennes. it is a well-huilt town, with wide strects, and in the "ld quarter retains traces of the midhle ages in the ancient arcules which still whtrule in sume phaces upon the strocts. The castle of F . is picturesque, but being commanded ly othor parts of the town, forms hint a feeble defence. in the ncirthburhool is a great forest containing 1)ruilical remains. A faimous engagement took Whace here letween the Vendean rovalists and the Repmhicaus, November 15, 1793. F. has manuficctures of sail-cloth, canvas, tape, Hancl, lace, bats, \&c.; and dyeworls, principally for the dyein! of searlet. In the vicinity are important glass and 1aper works. Pop. 934.
FOTLA, a solitary isle in the Atlantie, 05 miles west of the Mainhaud of Shetlame. It is 3 by $1 \frac{1}{2}$ mills in catent, and consists of five hills (highiest, 13 fect f), risin! steeply out of the watcr. The seacliff are sublime, and coverel with sea-hirds. The isle is sean trom Orkney in fine weather, and is surprosed to be the Cltima Thule of the ancicnts. It has ouly one landing place. It is inhatitend he alout 150 fishermen. F. consists of sandstone, with a small patch of granite, gneiss, wica-shate aud clay-slate in the north-cast corner.
FOULD, Achule, was horn in Paris on the :1st of Octoher 1800, and was edneated at the Lycie Charlcmagne, one of the most ectebrated establishments of Paris. He originally belonged to the Jewish creed, his family heing wealthy dew larkers, but now wheres to the Protestaut faitl. Garly in life, he was initiatel into financial transactions by his father, and his natural talents were develuped lyy travel in Europe and the Last. In 1St2, he beeran his political career, being then chusch as a meruber of the council-general of the llautes Pyréućes, and immediately after clected a dejuty fur Tarbes, the chicef town of that department. Ite smon acyuired a higu prosition in the Chanber of Depatics for the peculiar talent with which he handle questions of tinance and politieal conumy: ln 1844, he was apmointed reporter to the commissinn on stanus on newspapers, and lis views were allyited, in spite of the upposition party, he being at that period a stanch supporter of Di. Guizot's hame and foreisu pelicy. Atter the revolution of 1848, F. aceepted the new regime of the rephblie, and offered his services to the provisional movernmont. In Tuly 1848, he was elected representative for the department of the Scine, and emutinued to rise in pulblic estimation ly the elevated views lo expressed in the chamber, while opprosing anong of her thinus a proposed issue of assignats. Durime the presideney of Louis Nipmen, 13. was four times Minister of Finance, anil his repeatiol

pevent hin from leing again appointed on the weasinu of the roup itetut, id Decenber 1851. Ho unce mure resigned his position on the goth danuary following, in consequence of the decree ordering the contiscation of the property of the Orleans family. The same day, however, he was created a semator, and shortly afterwards returned to power as miuister of state. In this capacity, he superintended the Universal Paris Exhilition in 18:5, the completion of the palace of the Lourre, and other great ureasures. He remainel one of the most confilential ministers of Napoleon III. till December 1s60, when be was succectled as minister of state ly Comte Walewsky. He was out of office up to the 14th November 1s61, at which date he was reappointed tinauce minister, his long experience and well-known alility as at financier puintiny him wht as the man to manage the crisis of the French finances at that time.
FOULIS, Roeere and Andrew, two eminent pinters of Glastow, brothers, whose mames are usually classel together.--liobert, the elder, born in that city, April 20,1707 , was brel, and, like Allan lamsay, for some time practised as a barber-in those days of flowins preriwigs, a profitalle and respectable profession. Having attended for several years the lectures of the edthrated Dr Francis Hutcheson, then l'rofessor of Moral Plulosoplhy in Glasgow University, he was advised ly that gentle. man to become ab bookseller. In winter, he and his brother Andrew (born November 23, 171응 employed themselves in teaching languages; and in summer, they made short excursions to the contineut, and thereby acpnired a consicterable amonut of leanning and knowledge of the word. Andrew seems to have been desiment for the church. In 1727 , he entered as a student at the university of Glasgow, where he is sulposed to have undergune at regular course of study. About the end of 1739, limert heran business in Glasgow as a printer, his first puldications beine clictly of a religions nature. In 174?, he puldisheit an eleqant edition in to of Demetrius Phalereas on Elocition, supposel to be the tirst Greek work Irinted in Clasgow. In 1743, lie was appointed printer to the university. In 1744, he brought ont his celebrated inmaculate chition of Horace, 12no, each printed sheet of which was hung up in the college of Glasgow, and a reward offered for the discovery of any inaccurary. Soon after, he took his brother Audrew into partnership; and for thirty years they coutinued th bring ont some of the finest specimens of carrect anil ckegant printing, particularly in the Latin and Greek classics, which the 1sth c. proluced, cither in this country or on the continent. Among them were Ciceris works, in 20 volunes; Cesar's Commentaries, folio: Homer's works, 4 vols.; 1 lerodotus, 9 vols., \&e.; also an edition of the (ireek 'Festament; Gray's pems: l'ope's works; a follo clition of Milton, and uther publications in English. With the view of pronoting the cultivation of the fine arts in scotland, liobert Fonlis, after a two years' visit to the centinent in preparation, conmenced, in 1733 , an acadeny at Clasgow. for the instruction of yonth in paiuting and scnlpture. The great experise attending this institution led to the dechine of the printing lmsiness, which, however, contimed to be carricd on till the death of Andrew, September 18, 1775. In 170 , Rohert exhibited and sold at Christie's, l'all Mlall, Loudon, the remainder of his paintings, when, after all expenses were defrayed, the lanance in his favour amonuteal only to tifteen slillings. He diad the same year at Elinhurgh, on his return to Sonthand. He was twice marrici, and left several children. One of them was a printer in Glasgow as
late as 1806 . His Virgil, printed in 1758 , and his Aschylus, 1795, for leauty and exactness, were not unworthy of the name of Foulis.

FOUNDATION. This term may be applied either to the surface or bed on which a budidine rests, or to the lower part of the building whieh rests on the natural betl. 1. Founlation as the bed. - The best that ean be had is solid rock, or any kind of resisting incompressible stratum, free from water. Where there is no chance of water, samd forms a solid foundation. When the soll is soft, loose, and shifting, a solid bearing can be obtained only lyy driving piles or long beans of wood, sharpened at the end, through the soft suil, till they reach a hard bottom. This is then planked or laid with cross-beams, on which the superstructure is bult. The pifers of many bridges are formed in this manner. Where the soil is soft, but not slufting, as in the case of made or delosited earth, the method of Concreting (q.v.) is adopted-i. e., a dare surface is laid with broken metal or gravel, and rum together with hot lime, so as to form a broad sold artificial rock, on which the building may rest. 2. Foundation as the lase of the buiding. -The broader and larger the lower courses of the mason-work, the stronger the wall. The stones should, if Iossible, extend through and through, and project on each side of the wall.
la the lest periods of art, the fomdations have always been most attentively considered. The Ihomans formed solid bearings of concrete as above described, and paid great attention to secure the stability of their buildings. In the dark ases, when there was want of knowledge combined with want of materials and means, many buildings fell from the yielding of the foundations. Some of the carlier Gothie buildings also suffered from the same cause. But knowledge came with experience, and the foundations of the later Gothic buillings, during the 14 th and 15 th centuries, were built with extreme care, and on the virgin soil-the stones being as fincly dressed as those above ground, where necessary to resist a strong thrust. And where the weight is thrown mequally on piers and walls, these detached points are all carefully united below the tloor with a net-work of solid walls.

Bad foundations have been the cause of the min of many modern buildings. This has arisen fron the costly nature of making a good foumdation, when the sot is not naturally suitable. But it is clear that no expense shond be sjareal to make the fommation good, as the value and stability of the sujerstructure depend entirely on the security of the foumlation.

FOU'NDER, also called LAMTiTIT, consists of indfamation of the vascular sensitive lamine of the horse's foot. It is rarely met with in eattle or sheep, owing to the corresponding structures being in them greatly less developed. Oecasionally, the lamine are strained from severe exertion; more frequently, they suffer from the morbid effects of cold, which is espectially injurious after the excitement and exhaustion of labour. Very commonly also, they become intlamed from their close sympathy with diseases of the digestive organs, often following engorgement of the stomach, or inflammation of the bowels. All four feet are sometimes affected, more usually the fore ones only. They are hot and tender; the animal stands as much as possible upon his heels; trembles and groans when mored; and is in a state of acute fever and pain. Except when following superpurgation or internal disease, bleeding is useful. The shoes must at once be removed, and the toes, if long, reduced, but no further rasping or cutting is permissible. The
feet manst be conveloped in hot bran poultices, and kept off the hard ground by a plentiful supply of short litter. Soay and water clysters, repeated if necessary every hour, usually suffice to open the bowels, which are bery irritable, and playsic, if required, must therefore be used with extreme caution. Two drachms of aloes is an ample cluse in founder. Have the strain taken off the intamed lamine by gettixer the animal, if possible, to lie down, or, where this is impractiealle, by slinging him. When the inflammation continues so long that serum and lymph are poured ont between the sensitive and horny lamine, they must have free exit provided, by making an opening through the toe with a small ilawing-Enife. This may prevent the pumical and lisfigured feet that are apit to follow severe and repeatel attacks. After the acute symptoms pass, coll aplilications to the feet, and a mild blister round the eoronet, holp to resture the parts to their natural condition.

FOUNDING, or METAL-CASTLNG, is the art of obtaining casts of any desired object by means of pouring melted metal into moulds prepared for the purpose. It has risen to grent importance in recent times, on account of the many new applications of iron. Iron-founding, brass-founding, type-fonnding, as well as casting in bronze and zine, are the principal dirisions of the art. The casting of the finer metals and alloys, as gold, silver, and German silver, is necessarily conducted on a smaller scale.

When the casting of an object is required, it is necessary, in the first place, to make a pattern. suppose it to le a plain roum iron pillar, such as is used for langing a gate upon. A pattern of this is turned in some wood which can be reatily made smooth on the surface, sueh as pine, and then varnished or painted so as to come frecly ont of the monld. This wooden pillar, or any similar pattern, is always made in at least two pueces, the division being lengthwise, for a reason which we shall presently see. The next step is to prepare the monid. The moulds used by the iron-founder are either of sand or loan, bat more generally of tine sand. Proceeding with the preparation of the moud, the foumter takes a mouding-box, whieh is comprised of two open iron frames with cross-bars, the one fitting exactly on the other, by means of pins in the upper, ilropping into holes in the lower frame. Onehalf of the box is first filled with damp saud, and the pattern laid upon it, a little dry parting sand being sprinkled on the surface. The upper half of the box is then put on, and sand firmly rammed all round the pattern. The box is then earefully ollened, and. when the pattern is removed, its impression is left in the sand. The mould at this stage, however, is generally rough and broken. It is necessary, therefore, to give it a better finish, which is done by taking each half of the mould separately, repairing it with a small trowel, and re-introducing the corresponding half of the patteru till the impression is firm and perfect. Finally, the surface of the mould is coated with charcoal-dust, which gives a smooth surface to the futare casting. These culumns being made hollow, there is yet another matter to arrange before the casting can be made-mamely, the core. In the instance before us, it would simply be a rod of iron, covered with straw and loam to whatever thickness the internal diameter of the column happened to require. The core of course occupies the centre of the mould.
The cast iron is melted with coke in a round firebrick furnace, called a cupola, the heat being nrged by means of a powerful blast, created by fanners revolving at a ligh speed. The molten metal is run from a tap, at the bottom of the furnace into a malleable iron ladle, lined with clay, from which it
 (10) ?
 fiemol in the same. These perfinations are neres
 by the atem of the hot motal un the momh. 'ar munt alsa be taken mat to lave the womblan damp, "therwise stram is ynmateml. which may
 the metal wit of the momh. The canting remains coveral upe for a time in moder to conl shawly, ant is then romovel ly beakine away the sand, and Aranang the come.

In the case of a thatela or etherwise mannenterl pillar, the pattern wond renuife tula in at least fon
 fateron that will rome ont of the mould in hathers withnot torine away the s:mul. When a pattem
 ant af the mould lit hy lat, th the riaht wr left. ats the case may ho, amil su bats from the sami without heaking it.
Aumber that a mall ormamental rase was to sumbunt the pillar, the fomber would prepare the fattern of this in a nom claborate manner. H1. would first mould it in wax or clay, from which a cast in phaser of laris is made: from that, again, a cast is taken in an alley of tin and lead, which, after beine shaply chased, and diviled into the Fectured number if pieces, is used as a pattern to cast from. All arnamental patterns, such as fienres, serolls, leares, curiched momblings, and the lik., are male in this way, whaterer metal the ultimate castion is to be produced in.
Viry larse engine cylindes, pans, and such vessule, are cast in luan-moults, which are built of lark, phaterol with lom, then coated with conlotust, ami finally triod by weans of a fire. This methon is ahnitel with large phain mbects, whore a patern womb he "xensive, and when few castings of one kind are requrent.
fron monlls, watel with blaklead or phomago. have recontly been introluced fur castine phes into: they are greatly more expusive than any other lind. lut they mable the fommer to dispense with a pattern, as, when unce made isto the repuired form, they are mit destroyed like monds of sand or lown at each castins.
fromze and lorass are east in monds prepared with timer samd than that used for iron. Duwter amd simmar soft metallie allows are cast in hrass monlds. The type-finmer, on the other haml, uses monles of steel, which are now worked to a gicat extent hy a machime.
The rariety of articles prolued hy fombing of entiny are very momerns, amone nthers we may mention eylinders, eisterns, paperensines, beams, hoilers. puides, and the heary parts of machincy generally, gates, railings, lams, grates, fembers, wokingerssels, and the like, in mon : canon, many partions of machinery and momerous ornamental (h)jects. in lirass: sculpture and other works of art in lromze and the more costly motals. One of the mont romarkable eastings yet executed for the rephirements of modern enciwecrus, was the cylinder of the hydraulic press used for rasing the tulues of the Britionmid brimge. It measured a feet $\times 3$ feet 0 inches, the metal heing 10 inches thick, and weimbed upwaris of twenty tons. It remained red hot for thene liess, ane it was suren lays more lecfore men could apprach it to romone the samd. Sole plates for atwomammers, and fow wher purposes, have luen citist more than drmble this weight, lut the same care was not refuired in the execntion. In regard to sempture, perlaps the most womberful casting known is the colossal statne of Bayaria at
 high, the tace luine cqual to the height of a man. It tomk einht yoars to cast, and the cost of the

JOUNDLING HOSPI'ALS, estallishments in which chikiten that have lem abmanod hy thoir parents and fomm ly whers, are mortured at the puldie expense. Amomyst the anceent mations, these institutions wore not unknown, though as the law nsually phace the pewor of life and death in the hame of the fother. and promittel hime to sell his children into slavery, it is to la fared that infanticide, as ammon eastem mations at the present day, was the nsual monle of solving the dithoulty which fommeling hospitals are intended to mect. Hesertion, however, and wiposure as less atracions, were still more frequent crimes: and to meet these, the reception and education of fomedlings were enjoinei m prisate persons, to whom they whe assigned in jrtherty. When this means of support failed, they were pranceted ly the state. The Esyptians and Thelnans are praised by the classical historians for discouraging the exposure of imfants. The pratice of exposing infants palu. aldy prevailed even ammust the cremanic nations previons to the introluction of ("luristianity; and thomel Tacitus says that infanticine was forlinden, in lecland, in particular, it is sad to have reached a fearinl height. From the period at which Christinnity beame the state religion of the homan empire, a semsible change in the spinit of legislation on the sulijects hoth of infanticile and exposure is aprarent; and thengh the latter is spoken of by Gibhnn as one of the most stubborn remnants of heathomom. it gramally gave way, and the Christian chureh, at a vory daly period, lent its encouragement to the establishnent of founding hosuitals. So carly as the bith c., a species of fombling lospital is sain to have exrsted at Treves. The hishop promittel the childrem to he depusited in a marhle lasin which stool before the cathelval, and gave them in chare to members if the fomech. but the first well-anthenticatal one is that of Milan, establisher in $75 \%$, probally in ohedience to the foth artiele of the Comacil of Xire, which enjoined that a house should he establisheif in cach town for the repetion of chindren abmento by their parents. it is probable, however, that fundling hospitals existed pretty extensively at an earlier purionl, as mention is mate of them in the capitularics of the Frankish kines. In 10T0, a founding lospital was estahlished in Montpellier ; in 1200, in Embeck; in 1212, in Rome; in Florence. in 1317; in Nurnhers, in 1331; in Haris, in 1302 ; in Vieman, in Liso. In France, the utility of these estallishments, which were the special labmer of Vincent de Foul (4. v.), was early called in question; amb letters-patent of Charles VII, in 144, affirmed that 'many persoms wonld make less ditficulty in abundoning themselves to sin when they saw that they were not to lave the charge of the mplaringing of their infants.' In Germany, the systern of fomellins hospitals was soon abantoocd, the chaty of rearing the children leing, as in England, imposed hy law, lirst on the parents, then on more distant relatives, whom failing, on the parish, and last of all, on the state. The reproach made by Roman Catholic eomotries against this more natural arramement-that it temb to promote infanticile -is said to have heen in no degree established by statistical investigations. The revolutionary government of France mot only alopted the system of fremelling hospitals, as it had been handed down to it, hat in 1790 drelared all chikiren found to be ehilimin of the state (mfients de la patric). Niay, as a still further preminu on immorality, it declared

## FOUNDLING HOSPITALS-FOCNTALN.

that every girl who should declare her pregnancy should receive a premime of 120 francs! the imperial government, in 1511, abolished this insane chactanent, continuing, howerer, the arrangment by which the fombling hospiatals had become sovernment establishments, am the childern, chidiren of the state. The system is still adhered to in France. where fomming hoepitals exist in most of the large towns to the mumber of ahout 1t1; in Spam, where the number is estimated at 70 ; and generally in the Loman Catholic comatries of Europe ; and fighes are bromeht forward to prove that it has nut exhibitel what wonk seem to he its nberions tembenc: The number of children depnsited in the revolving cradle at the Hospital in l'aris, in place of increasing, is said ly the adrocates of the system to have dimimished in fromortion to the promation ; lut the statement is utterly deured by demman aml lrotestant writers. The expense of raring a child to the age of twave in the Hospital at louris is 952 franes 4.3 contimes, or tritle less thin \&40. The moment that the child is recerved it is weighed, and if its weicht be less than six pomds, it is considerel that its chance to lise is very mall. It is then inscribed in a register, amb a formal statement is clrawn $u$, of any name which may have been given along with it, or of any particular mark which it bears either on its person ur otherwise; of the har at which it was depusiter, its sex, and its dress. It is then inspected by a metieal man, and hamled wer to the nurses. It faris, each chide is eommitted to a special murse. many of whon are retained on the premises. amd pail to centinns a blay. Other murses are brumgt in from the comentry in carriages kept ly the flospital. which return ennvering the children alone with their new mothers. The chililren thus boarden out are inspected twice a year hy lucal medieal men alpointed for the pmopse; but the surveillance is two often negligent, and consequently the tratment of the children loy no means such as to conduce to their health. The parents, and imped the relations of the chiden, are pemittel to recham them at any poriod, or they may be legally aiditen by any French citizen who is in a conditina to maintain them. Notwithstanling the precautions of which French uriters boast, the mortality amonerst these "infants of the state" is very appalling. 'Their average life. it is said, dues not exceed four years : $5:$ yer cent. dying during the first year, and Ts per cent. during the linst twelve years. Only 22 out of 100 fonndlings thens reach the aqe of twelve. whereas in the general jomulation in ont of 100 live to twenty-one. As might naturally 1 . sup posed. thise who lon survive and are nsherel inta the world withont friends or means, constitute is large froportion of the thieves and prostitutes of the country. Of the male convicts and prisoners of France, 13 per cont. are fomollings, and female foundlings form on efiftlo of the immates of the fublic houses of prostitution. The question of the propricty of enconraging secrecy ly the use of the turmine-box, or of causing the parats openly to deposit the chindren in the hands of an uficer, has leen, and is still discussed with much lecenness in France. The argment in favour of the furningbox is that by which the whole institution is defendel, viz, that it tends to disecmarare infanticide. and statistics are sail to he rather in favour of it in this point of siew. But there are many other obvions considerations of morality ant jublic prolicy to be taken into aceomet, which would serve to countermalance this alvantage, eren supposing it to lee real. Many Protestant states have established fonndling hosnitals; and those of Moseow
and St Petersburg are among the largest in tho work.
The Foundling Ifospital in London was estalslished by (antain Thmas Coram, a henevolent salur, in 1739 , as an lumpital for exposel and deserted children.' 'The gromd in Guildord Strect was purchasel from the Earl of Salishury for fomo, and the architect of the hospital was Thembure Juenhson. 'The system of fond ding lospitals never having leen approved in England, the Lombon hospital was changed in 1760 to what it now is-ric., an hospital fur perg illegitimate children whose mothers are known. The committee, previons to admitting the chid, must be satistied of the previnus ghal character and present necessity of the mother. The pmalification for a guvernor is a donation of foth. 'like great 11 amel was one of the chiof benefactors of the haspital. Ilo condowerl it with a magnitient orem, and frequently performed his watorio of the Messiuh in the chapel, which is still celehrated for its music. 'Thongh evry attention is pail to the health and comfort of the chilhen at the Fumuling-to such an extent, imbuend, as very often to unfit them for the hartships which many of them must encounter in after-life-we have leem infurmed ly the plysician that they do mot attain to the lowight of average Bhglish men amd women. There are no founding hospitals in the Thited states: lat they exist in Bexioo, and in almost all the states of south America.

FOUNTAIN, a basin or jat for the supply of fresh running water. There are fonatains of every form and variety, from tha simple spring with its natural basin, to the most claborate and ommental structure fir the dieplay or suplly of water. In all ages, fountains have heen emsirleresl as pulbie monuments of the greatest importance; and where the somed for their supply has int been provided by nature on the sput, immense labour and expentiture have often leen incurral to make no for the deficiency. The splemblid Aquednets ( $\mathrm{m}, \mathrm{r}$. ) of the lomans are instanees of the imprortant light in which they regarder the fountains of their cities. Every Roman town hal at last one aqualnct, the water from which was elistributed to as many fome tains as the population required.

Ltility is the first olject of a fountain, and althouch they are frepuently mate sulojects of great disphy and mannificence, the tinest fontams are those where the water is the greatest omanent. In the middle ages, fountains of great beanty and varicty of form were luilt, hout the useful matire of the strmeture was nover lost sight of. Sometimes a spring was arched over for pratection, with a leantifil rault. and a statue of the patron saint phaced in a miche, with a basin bedaw to contain the water. In towns where a number of juersms night require to draw at one time, a large hasin was erecten, with a pillar in the centre, from which dipes radiated all romm-cach with its scemarate jet to supply the ruminer water-while the basin was used for washing the pitchers. Many examples of this kind of fountain remain. In the following page is representel a fomatain at Viterlo, in the lapal States, where there are many of the same deseri]tion. The pillar is sometimes summounted by ia statue, or las one or more smaller basins. with ormamental streams and jets of water falling from tier to tior. A beautiful fombain of this uature existed in the royal jalace at Linlithgow, amd a copy of it has recently been erected in front of Holyrond Palace.

In molern times, the Freneh have distinguished themselves ly their magnificent fomatains, those of Paris and Cersailles belng almost unrvalled. In

the water is thrown．Although lione has lost fome fifthe of the mumants which so lavishly supplied her with fresh water in the times of the Empire， she is still unsmpassel for the number，beanty，and utility of the pallie fomtains which adom her strects and lances．

Alown fountains are，for the most part，entirely ornamental．This arises from the morem mode of distributine water in pripes through the homses， making the strect－fountains to a great extent useless．It is fond，however，that our town pmur－ latinns－loth man and beast－recuire some pulbie surplies of water，and these are now largety supplical by the numerous drinking－fowntains which are being constructed in all our principal towns．

FOUNTAIN．Water is represented heralilically by a round ball，haring wavy stripes of blue and white，burways，caller a foutain．
 la Motre，a molern German author，was grandson of the l＇ussian weneral of this name，distinguished in the Seven Yars War．Born at Prandenhurs， 12th February 1777，F．served as Prussian otheer in the campaigns of 1792 and 1813．The interval between these eampaigus was devoted to literary $l^{\text {ursuins }}$ in the country，and the rest of his life was spunt alternately in Paris and on his estate at Nemhansen，and sulisequently at Halle．He died in Berlin，？ 0 ．Tannary 1St：\％F．appeared first moter the name Pellegrim，as translator of Cervantes＇s Trumancio，and author of some effusions in the spirit of S＇anish pootry．lint the Norse legends and old German poetry attracted him most strongly ：this was evinced in numerous pomances，in prose and verse，which picture the old life of medieval Enrope． Among the lest known of these are Siguri，der Soldententioder（1809）－－the lirst work to which F ． attarhel his real name－Der Zeuberring，Die Faturlen Thiotolf＇e，and Undine．Suceussful in exhiliting many of the heauties of the romantic school，he is yet chargeable with all its extravagances．Straining tow，oftin after fintastically umatural conceits，lie seems fas－inatell lyy the antifuc life which he jixe－ tures，rather merely from its cuaint contrast with menlern momers，than as a form into which the hife of actually living men had shaped itself in fomer
times．He has himself culted a selection of his works（－1 userwälte Werke， 12 Ble，Halle，1S41）．－ Fis tirst wife，Kamonne von Briest，is also known in cremumy as a productive authoress．
BoUQUilidTINVILIE，Antone Quevin， the noturions public accuser in the French lievolu－ tion，was born in the village of Iferoucles，in the department of Aisne，in 1747．His early career was immoral，hat insignificant．On the outhreak of the levolution，be ligured as one of the liereest demo－ crats．Jy hobespicrre，he was appointed，first，a member，then director and pulbic accuscr，of the Revolutionary Trilounal．Without elucation，con－ science，or sense of justice，he excented with brutal apiathy the blooly wrlers of the Committee of P＇ublic Safety．In reference to this feature of his chamacter，his countrymen say that he had no soml －not even that of a tiger，which at least pretends to be pleased with what it devours．＇Incapable of friendship，or of anything even rennotely allied to generosity，he systematically abandoned his successive coadjutors in their hour of need，and sent to the seaffold，without the slightest com－ punction，Bailly and Tergniaud，Ininton and I Hebert， Aobespierre and st Just．He himself died lyy the suillotine，in a cowardly maner，7th May $170 \tilde{0}$ ．

FOUR DVANGELISTS，mart of a larger gromp of islands known as the Theple Apostles，lie off the west entrance of the Strait of Nagellan．They are about lat． $52^{\circ} 34^{\prime} \mathrm{S}$ ，and long． $75^{\circ} 5^{\prime} \mathrm{W}$ ．The cight other islands，with which they are classed as above， rum about 15 miles further out into the Pacific．
FOUR LAKES，a chain of connceted shects of water in Wisconsim，Cuited States，are fed chielly ly springs，and form，through their outlet，the Cat－ fish，a north－eastern somre of the Mississippi． They are navigable for steam－hoats，nut drain a leanitiful country．Madison，the capital of the state，stands on the strip of lime which separates the uppermost of the series from the next in order．

FOURCRO＇YA，a genus of plants of the natural order Amarylliderp，nearly allied to Agave（1．．．）， but with stamens shorter than the corolla．The species are all tropical．The leaves of some－ berhaps of all－of them yield a fibre similar to the I＇res Flik obtained from those of species of Ay＂tre．

Founier，itean Biptiste Tosefit，Baron，a ristingnished French mathematician，was born of a respectable family at Auxerre，2lst March 1768. He became a pupil，and at the age of IS，a professor， in the military school of his native place．He was afterwards removel to the normal school in Paris， and then to the Polytechuic，and aconmpanied Gene： ral Bonaparte to Egypt．Besides performing politicai services on this occasion，he was sccretary to the Institut a＇legupte，and an active contributor to the Iescription de l＇Egypte，the masterly historical introduction to whieh is from his pen．On return－ ing to France，he was made prefet of the department of Isere in 1802，an office which he hek till 1515， and was created baron in 1505 ．As préfet，he succecded in draining the marshes in Bourgoin，near Lyon，which had for centuries baflled all attempts． On the return of Napoleon from Elba，F．issued a royalist proclamation；notwithstanding which he was appointal by Napoleon prefet of the department of the lihone，but was shortly after removal．He now took wh his abode in Paris，and devoted himself exclusively to science．The Aculemy of Sciences， which in 1507 had crowned his essay on the propa－ gation of heat through solid bodies，chose him a nember in 1S15，and afterwards sceretary for life， conjointly with Cuvier．He died 1Gth May 1830.

His most famous work is the Theroric Annalytique

## FOURIER-FOURIERISM.

de la Chalour (l'ar. 1822 ), in which he applies new methods of mathematical investigation. An allied subject is discussed in his Mémoire sur les Temperatures du Globe Terrestre et des Espaces Planétuires (Par. 1827). Besides Leat, he occupied himself with the theory of eruations, which received from lim important improrements. IIs work, Analuse des Equations Determinées, distinguished both for its substance and manmer of exposition, was left unfinisher, and was published after his death by Nibier (1ar. 183I).

FOUlilidi, François Marie Cimfees, a French Sncialist, was born at Besançon, 1 pril 7, 17\%. His father, a moreliant, had him educated in an academy at Besançon for his omn professinn. He distingiished himself by his perseverince and success in sturly, and excelled in geograplby, mathematics, musie, and the natural sciences, Ile left his stulies with regret to enter upon the duties of a merelant's clerk, which he performed with zeal amd integrity at Lyon, Ronen, Marscille, and Bordeans. Ile also travelled in the interest of his employers, not only in France, but in Molland and Germany: In these journeys and residences, nothing escalred his obsersation: he noted elimate, culture, punilation, public and private edifices, and remembered evorn the topography of villages, and the dimonsions of buildings, with astonishing accuracy. His father lied in 1751 , learing him about $x^{5} 5(3 n$, which lie became possessed of in 1793 and invested in trale at Lyon. 'Ihis was lost in the Revolution; and le Was thrown into Irison, and compelled to serve two years as a cavalry soldier. Discharged on account of illuess, he obtained employment in a mercantile honse at Marscille, where he was employed to superintend the destruction of an immense quantity of rice, held for higher prices, in the midest of a scareity of food, until it had become untit for consumption. This eircumstance ealled his attention to the frauds and dupheitics of commerce, and he devoted his spare time to the study of social problems, until he developed the system of Socialism to which his name is commonly given. This system is contained in several works, written and publisled under discouraging circumstances. In 1 Sos, he published his Thérie des Quatre Mfouvemonts, et des Destinees Génerales ('Theory of the Four Movements, and of the General Destinies of the Human Lace). In 1822, he produeed his Traite d'Associntion Domestique Agricole (Treatise on Domestic and Agricultural Association) ; in 1599, Le Noureau Monde Intustricl et Societaire (The New Industrial and Social World) ; in 1831, Piéges et Churlotunisme des Denx Sectes Saint-Simon et Owen, promettent CAssociution et Progrès (Suares and Quackeries of the Two Sects of St Simonians and Owenites. promising Association and Irogress) ; in 1835, La Fausse Industrie, Morcelé, Iepugnante, Mensongire, et I'Antidote. IIndustrie Naturcle, Combinée, Attrayante, Féridique, domnunt Quadruple Produit (False Industry, Fragmentary, Hepulsive, and Lying, and the Antilote, a Naturill, Combined, Attractive, and Truthful Industry, giving Quadruple 1roducts). These works, written in the Iuidst of conmercial ${ }^{\text {pursuits }}$, and $p^{\text {mblished at long }}$ intervals, by means of his small savings, fomind for many years ferr readers, and no disciples. Towards the elose of his life, a small group of intellectaal men accepted his views, and gathered round him, to learn the details of his social system from his own lips. He was unwearied in his efforts to interest men of porver or eapital, who could give lis theories the test of practical realisation, and for many of the last years of his life waited patiently at a certain hour every day, expectiog to be visited by such a patron. Ilis less patient iliseiples jrobably
hastened his deatly by immature and prirtial efforts at realisation. He died in Paris, October \&, 1837.
FOURIERISM, the Social System invented by Charles Fourier, is eontained in his pulblished works, in a large collection of uapublished MSS., and in the writings of Considerant, Lechevallier, Bristhane, and others of his diseiples. It differs materially from the systems of Communism strictly so called, and all other social theories, and professes to be based upon natural laws, and capable of heing carried out on mathematical princijles, as fixcl and certain as those of geometry, misie, ir columrs. The earth and human socicty, Fourier taught, are in their crude and infantile stage. The period of the race will be 80,000 years, the latter portion of which will le its declining phase, as the prusent is its ascending. The nidile tern will be a long yeriol of maturity, prosperity, and hapriness. What we call civilisation, Fourier considers a false and imperfect condition, with poverty, crime, ignorance, illeness, repuguant toil, disease, wasting wars, general antagonisin, oppression, and nisery. He believed that Association would proluce gencral riches, bonesty, attractive and raried industry, health, peace, and universal halyiness. Considering attractions and repulions the governing forces of all mature, and that God has distributed them for the halpiness of all 1 lis creatures, he hell that 'attractions are proportional to destivies,' or that the desires or passions of men, their aptitules and inclinations, if they could have free scorpe, would infallibly 1 roduce the highest coulition and greatest lanpiness of which they are capable. IIe lelieved in a universal barmony, tlowing from and ecntering in God, the author of all harmonies, and that, there is therefore a principle of 'universal analogy.' secing that all things, from suns and planets to atoms, range themselves in grouls and serics, according to certain fixed laws of attraction and rejulsion, he labonred to discover the kind of human society that must eventually form itself in obedience to those laws. This is the Association or Plaalanstery, which is to consist of 400 fanilics or ISU0 persons, which number he found included the wholo circle of human capacities. These should live in one immense edifice, in the centre of a large and highly cultivated domain, and furnished with workshinps, studios, and all the appliances of industry and art, as well as all the sources of annsement and jleasure. When the earth is corered with palaces of attractive industry, the associations will also unite in groups and series, under a unitary government. There will be but one language and one government, and the only armies will be the great industrial armies, whieh will drain swanns, irrigate deserts, jlant forests, and effect tho amelioration of climates. The system of Fourier does not fropose to destroy, but rather to conservo property, position, and hercditary rights, nor does it war directly with morals or religion. The property of the Association is to be held in shares, and the whole product of the industrial and artistic groups is to be divided into twelve parts, of whieh five parts are due to labour, four to capital, and three to talent. The apartments are to be of varions prices, and the styles of hiving to vary in luxury and cost; but the poorest Ierson in the Association is not unly to be secure of comfort, but his minimum of enjoyments will be greater tlian the present social arrangements can give to princes and millionaires; while these will have orened to them $\mathrm{p}^{\text {leasures of which they can now searcely have a }}$ conceltion. The economics of the large scale in the 1 'lananstery rednce by two-thirds the expenses of living, while an attractive and scientific industry would quadruple the products of civilisation.

## FOLRII ISLANDS-FOWL.

The pracums af the human sond to which the

 albername and compiste. In the the fond the spmas of mantry ame true somety. Emmlation, the derize of shecess. lommors, sewates, is the freat stmulant a werthon : altamation of omplagcochts makes work a recreation: amt the comfante jasam requires combinations wi chatm amp anjomont which only Ansceiation can give. Many attents have ben mate-a fow in Fotace and momen Am riea to carry the ideas of Fouriterinto pracical reatisation: hat they have all heen on a shabll mable, and with inallyuate means, amb hate resmltal in failure. Whatever we may think of the system, in its primeiphes or its theoretical develop-
 such expriments. It ramains to be poved whether haman mature, in its present state. is capable of carring out suctesfully a sucial systom so whely varyme from all ixistime social contitions. The moral ibjoctims to Fmbrism are, that it aymars to make luxury, ambition, and semsual delights the and of existence - the incentives and revards to all exwtime: and that the passions of men, whem left in the perfect frecionn which this system rejuires, would had to ruinnens demoralisations. The answer is, that "attractions are proportional to destinies, and that these excesses helong to the present state, and are incilent to the forerty and repressions of civilisation, but could not exist in a true suciety: which raises the question-What is a true suciety? Whatever may the thought of the ractionality of the system, its stuly in the works of Fonrier is full of surgestions to the student in socindugy.
 a group of athent 20 small islamis no the Girecian Archipelam, between Niearia and Simmes, on the casterm const of Asiatic Turkey: 'Ihe largest of these inlets is ahont tive miles in circuit.

FOWEY, or FOY'. a borough town on the smanth coast of ('urnwall, on the right hank oif the river Fowey, 易 miles smath-sonth-west of Lanceston. It is shelterch by hills, and hes amid pheturestue scenery, rude ser-clitls, and promontories. 'the harlour admits large vesscls at all states of the tile, aml its entrance is garded by three fort:The chicf lusiness is catching ant curins pilchards, which, with 'chima-stone' and iron-ore, form the main expurts. F. sent ti ships and 7.0 mex to the siege of Calais loy Eltwad III. in 1:37. It was hameid by the fremeh in 1457, and taken by Fairfax in 1616 . Fop. ( 1861 ) 1450.

Fowl fier. reyt : allied to the Lat. roat fuys, to Aece, and perhap to uret, a word arimaily symmynous with bind, and still employed bin that signiticatim, but also in a munh more restrictal sence, as the alesionation of the gemus of Birds (Gillus) to which the common Donnestic Fowl ( $G$. dementiens) holnors. This genus gives its name to the important ,reler of Gidlinumenes Liork, also called, from their well known habit of seraping the earth in scarch of frool, linwors (Lat. Scrapers) : aml is inclubled in the famly Phasionider, with pheis:unts, tragnoms, der. The : Sencral form, and the charaeturs of the hill, fuct. © ©e, agree with thuse of the pheasats; lont the crown of the heal is generally: naked, amd furniwhed with a thesly comt, the hase of the lowner manhbles also forines theshy lolass on tretlex, haracters which are mot conspicumas in the males; anl the tail is very different irum that of the phoasanta, inh imbed, very simenlarly fomenh, being ampode of fomteen feathers in two nearly
vertical planes, or as if a lomizontal taill were fobled therther, so at ta maki a sharp augle at top, tha tho minhu feathers being the mpronost, and me the matho chosated beyom the rest, and gracefully archal. The tallewerts of the male are also very amplo, ond the fathers of the lack of the howi amil of the nock are cithr chomated and lousely webbed, fomming the hockles, so muth valuet ly auglers for dressmin artiticial tlies, or are otherwise momitied to sorve the purpese of adormment; characters which are alos sometimes exhbited in a very inferior derree in the female sex. The legs of the male are armad with spurs, as in the phemants, of which much use is male in the combats of these limels anmes themselves, all of them Wins very pugnacious. They are all folysmons, ame nuable to endure the presence of a rival. They are all matives of the Fant Imbes and of the Malayan Archiplago. Fiom what country; and at what prion the Domestic Fowl was orisimally introducel into burope, is nucortain. The remains of Engtian antiquity carry us back to a feriod when it was apparently unkiown in Erypt, and there is no distinct allusion to it in the Ohil Testament; but it seems to have been common in the sonth of Purope from the carliest iges of burpean civilisation. The coek was sacred to Apollo, to Merenry to Mars, and to Fsculapius. It was hgared on Grecian aud homan coms and gems; it was highly valued for its conrage aml jugnatity, and the sport of cock-fightine was a fiwourite one both with the Greck anil the lomans, as it is anmost the Chinese, the Malays, and many other nations at the present day, and in fowner times was ammest all classes of society even in Pritain. Se Cock-fightise. The Domestic Fowl appars to have been known to the ancient fritms lofore the Loman invasim: and when the South Sa Islands were tirst risited by Eurmeans, it was fonm there in the same domesticated state, aml there also cock-fishing was found to be a fashionahbe ammsement of the savige natives. The native comery of the Domestic Fowl is not certanly kiewn, hor is it certain what the spectes is in its origimal state: The ancient Grecks sumetimes called it the lemian Bird, and hence it has been sulpmsed to be a mative of I'ersia; hat there is nothing clse to supfort this opinion, and it seems likely enongh that this anmellammay most only indieate its introductime into cirecee from Persia. The Jungle Fowl uf lutia, the first suecies of Gallas kumin in its wild state to maturalists, was for some time supposed to he the migin of the Domestic Fowl, lut to this Minion there are strong objections in the rery peculiar character of some of the feathers which distinguish the Jumale lowl, and of which no trace Wer alpars in the Domestic Fowl. Nore recently, the liankiva fowl and other species have been diseovered in Java and other islams of the Eastern Archipelage more nearly resmbling the bomest ic Fowl, anil the distribution of the latter throught the inlands of the lacitic Orem is farourable to the lelief that it derived its origin from that region: lint still the identification of the species rumans diffenlt, and some naturalists incline to the Minion that the lomestic Fowl may be derived from intermixture of distinct wild races.

The linkiva Fown ( (i. Bunkiva), native of Java, is extremely similar to some of the domestic varieties; intecul, Sir William Jardine says: "Many hantans so nearly resemble this bird, that there winhl be great difficulty in making a distinction. The comb is large amillobed, or dentclated: the colnurs are brilliant, stecl-bhe and chestnat, back and yellowish hrown, the hackles abundant and fhlm watare: some parts of the plumage exhbit. mog a very tine $1^{\text {lay }}$ of columes. A very similar

## FOWLER'S SOLUTION-FOWLING

species, or a variety of the same, but rather larger. is fomm in sume parts of continental ludia.' Very similar alsor is the linowze Fows (G: apous), found in Sumatra, a birl resplendent in metallic green, purple, and lake; but of which the comb lass the upper marsim unbroken : the wattles atue combinet into one attached to the centre of the throat; and the neck feathers do not assme the hockle charater, which appears in the neighbourbool of the tail alone. These preculiarities also belony to the Fori-taleis Fowe. ( 6 : juretus or Jarenicus), a species very abundant in the jungles of Java, and often to be seen on their ontskirts, nemly two feet in length from the tip of the lill th the extremity of the tail. A still larger species-if, indeet, these are mot rather varintin's than spenes-is the Gigantac Fuwh, Jago Fowl, or Kula Fowl (G: gifonteus) of sumatra, with doulde wattle moler the throat, almalant haekies on the hewn, neck, and uper part of the back, creen and redish ydiow the principal colours, and the height considerably more than two feet. The Juside fowa (G. Sonneratii), abundant in the higher woonled districts of ludia, where it is much songht after by Eurprean sportsmen, is alwat equal in size to an ondinary Domestic Fowl, but is more slember and entacefal fin ity form ; the comb of the male is lares, and its margin liroken; the colours are rich ami leantiful but a remarkable fendianity is exhilited in the hackle foathers, which are terminated ho dat homy plates of a gohen ormen cobotr, inta which the shaft expands, or the shaft thickenines and termi natiog abruptly gives rise to a batthenere-like stem and dise, in substance like the tips of some of the feathers of the wax-wing.

Of the Domestic Fowl there are some very chrions varicties, of which some maturalists have attempiter to constitute distinct species, particularly the Nedrat Fowl (d. moriu), rarely seen in British pultrypards, remarkable for the lack colour of the periostham (the outer covering of the bones), and the dull purple of the comb, wattles, and skin; the Siliny Fowl ( $G$. lenatus), very common in china and Japan, with periosteum and skin of the same dark colour as the Negro Fowl, lint the desh remarkably white, the comb and wattles purple, the feathers with welss disunited and silky; and the Filiestusis (probably a mistake for leazzaen) Fow ( (f.crismus), which has all the feathers standing nearly at right angles to the body:

There are also varictics of the banestic Fowl reuarkable for what may le eonsilered monstro-sities-as the want of a tail and of some of the last vertebres, the presence of an auditional spur on each leg (Dorkings, \&c.), superalmodant combs, crests ar tufts of hackle feathers instead of eombs, tufts of feathers spinging from the lower jaw (the sidenian Fown), \&e.; and there are mathy varitios estemed loy keepers of pultry: of which the must important are-l. The (fase fows, with oreet and slomiles body and shewy endors, valned also for the delicacy of the thesh and of the evers, althongh the egess are rather small. It is this lareel which is used for cock-fighting: and so excessive is the fmguacity which characterises it, that brods scarcely feathered are occasimally fomm to have reduced themselves to utter blimhess by their conbats. Some pomltrykeepers thiak it goonl to have a game-cock in their poultry-yard, on account of the impurment of the quality of the fowls sent to the talle; but it is ahmost needless to say, he must, like the protutypu of Lobinson Crnsoe, be sole monarch of all he surveys. :' The Dormine Fowl, so named from Dorking, in surev, where it has long been bred in great numbers for the London market-a breed characterised by au additional spur on each leg;
riften of a white colnur, with short lews; one of the most nseful of all hreeds, poth for excellence of thesh and for almatance of ches. 3. The lowish Fowr, hack, with a white tuft, a lreed very extensiwly reared in France, Enght, \&e., little inelined to incubation, bat valued fur an almost uninterrupetel laving of egers. 4. The spastsil Fuwl, very similar to the lobish, lnt larger, and laying lareser exgs, on accoment of which it is now much valuen, and very emmon in lbritain; lack, with white checks anillarge red eomb). 5. Thoe Madiy Fowt, tall and handsome very pucnacions, but little estemed. 6. 'The Ilambing, of sery beantiful plumage, and much valued for the quality both of tlesh and eges, as also fon extreme prombe-
 lares, tall, unaraefnl variety, with small tail and whoss, for which there was a great rage anomg ponltry fanciers when it was newly introblecel into linitain, and partionkarly about the year 1503 , and which is valuahle chicelly on aremont of ite feemolity, tug homp laid even during winter, and the hens incubating frepuently. S. The Lixcisu Fowl
 useful.- Of most of these there are many subs. varietics and juncy breds-wohl-pencillen," silverfomeilled, \&e. The comman Doverille Fowe is apparently a hred pouluced by the intermixture of others. aml perlialis chiefly a less :raceful. loss spirited, and less pagnowions race of the (iame liowl.
Conceming the treatment of the Domestic fow in the pembltry-yard, the disases to which it is lialle, de., see locetry. The artiticial hatehing of exers is noticel in the article laceliation. ('moncoming the ergs of the Domestie Fowl as an artiele of commore, $火$. , see Ede.

The realiness with which the lomestic Fowl can
 ber lnoper for a brom, is not nearly equalled in the case of any other domesticated hird, and greatly rnhances the uspfuluess of this species to mankind, whether the eqgs are used for fond, or, hy artificial hatching, made to produce ehickens, as is common in Fegyt and some other comeries. Few hens imeabite oftemer than unce a year, bat some lay in the course of a year even mure than 200 exes.

## FOWLERS SOLCTRON. See Anseare.

FOWLING-the killing or taking of hirds for the sake of their thesh, feathers, \&e-is very variomsly practisen in dillerent parts of the worlid. In some places, it is one of the principal employments of the perple, who greatly feprod on it for their subsistence, and prosecute it with the greatest tuil and danger; elsewhere, it is in some of its forms a recreation, for the sake of which much expense is incurrea by the onulent. 'The moles in which it is practised iflemb bartly on the hahits of ditlerent kinds of hirels, and partly wh the prevess of eivilisation and the arts. The permliar hahits of some linds remeler it verycasy to take or kill them. Nects are much nsed in the captmre of many linds of birds, partiaularly of small limis intended for the talle: hirdlime is cmpleyed for the same purpose, and birts are taken by means of it in ureatest numbers near their drinking-places, partionlarly in het and diry weather : gins, springes, and trals of varions limis are also empluyed.

I'he muncrus kime of ducks, geese, and other Anethle", are, in an evonomical "nint of view, anong the most impurtant of livels: and the methods cmplosed for their capture are very varions and interneting. Thess, lowerot, we reserve for a selmate article, Whlorowl: and refraining also here from any autice of the amusements of the

 many muthern cuanta amb inhols in a grat measure depean! for their me:nas of sulisastumer. of all kinds uf iow lime, it is les for the most alvontmrous. "The
 terns, quillemots, and other sealobils, wholh freguent the mont lufty preapices, ami brewt on their
 them, is generilly emars, and uf it fishy tast be yet it forms great part of the forse of tha jumer people, butle fresis, ami salted for wintar provesums. 'The" lhesh of the gonme is mone tember and phosant than that of ahnit linils. Ahe wess of some species ate son-zht after by the sanme perabus moans as the lieds thanselves "lloe fenthors, tom, abe an article of commerce. The perphe of at Jilla pry part of their ront in feathors: and tlee moks of that islam! are apportioncal amome its inlablitants ase exactly as its mil. Shment arem man in the island is ia crassman ur rock-fowler, which is pretty nearly the ease also in many wher northom isles. The moltitmles of setfonw aromm many of the rocky northern comets is probigions, resembline at a elis-tance-as may be seen at the Lhass linek in the Firth of Firth-the lees around a busy hive. ['minhalited islets are ammually visited ly fowlers, as Borrera hy the fenple of St Kilia; and the - stactis, or had imsular rocks near the shore, are often extromed prolnctive These ars of chuse, ronched ly mean = ui a hont : amd whilst hanting is often both didicult and dangerons, the climbine of the precipice is still more so. The Norweman fowlers, "ip 'limberm,' earry on such expeditioms with it bird-pute or torelimy-staff, abont tive or six yards lone: whil a roge of several fathoms. The hird-puld las an irom hunk at owe end: it has also a that heal: amd ley merns of it the fowler is pushed and ernibled hy his enmrales below as he ascomes or very steep us precipitous chtl ; by means of it, also, he strikes duwn or draws in birds. The rope is used to fasten two fowlers together, bemg attached to the waist of cach: thes aid one another in climbing, fushins. and dravine one amother up the rocks, the safety of the one often demending on the strencth and eoname of the other, The biri-pole is also usad with in small net attached to it, in the capture of limes that are flying around. The Norwhion furlers somutimes remain for days on ledges whore hides are ahumbant, slephone in holes on clefta, aut haviog fuod let down to them ly a solue from abover.

Still more purifons, if possilble, is the mode of fowling praticell where the precipices eannot be scaled. Jha foubler is let down ly a rope, and lanes in mid-ain, often at an fevation of seremal hmolral fect, thove romeh rocks or roaring waves : amd lyg menas of his fect or of a pole, throws himself out tiosuch in distance from the bate of the rock as to oltain a viow of all its ladees and crannies, to which, with astmishing comlness aml dexterity, he direets his vourse, witen also eateling the hirds that liy wear linn in the air. Sjenaling of the fowbers of sit Kilda, Wilson (Tomeye Round the ("vants nt simelomel remb the Istes) remarks: "How one man (fins such is the ease), himself stand. inf with the guints of hia thes wom the verer of a prechise many humdred feet deap, can, with
 entire weirht of anotlur wan botumbing from point to point bubw him with irropular and frerpent

liut we awertained that thero is nover more than a simely man abose supporting the weight of the ane lubw. Liach of these couple's has two ropes "Lhe rne which the nyper mon holds in
his lands is fastoned roum the body and lemeath the arms of him who lesconls, while another rone is pressed by the fent of the upper man, ant is lachet in the hand of the lower.' The second rope is forgiving signals, ami for semling up birds wher captured. The primeipal rupe is made of raw cowhild, ent intu thongs and twisted; it is so dumalble as to last for two penerations, and is bequenthed as valnable projerty liy father to son. Other anaterials, however, are used elsewhere; and the prantice ditlers also as to the nmmer of comrades fohding the rope above. In tha Farue lsles, where some of the precijuces are 1400 foct in height, the rope is usually held ly it number of men. In sonne of the senttish ishmis, fowlers have been adventurous cnongh to dese'mil the chills unaided, fasteninis the rope for thenselves to a stake driven into the" gromed ahove. The fowlers of the Faroe Isles sonetimes use the fiole witl net at the end, whilst suspended in the nir. It is not unusual for the fowler, when he finds a ledre or reeess in the precipice abommling in birels, to disengage himself from the man whilst he pursue's his lahours there; but when the preeipice overlangs alove, be is exposed to a great danger of the rope's escaping from his reach. A case is on recortion which the only resure of the fowler was to make a desperate spring and catch the rope, which lung a few feet before him in the air ; and this he sneceeded in doin:

The ent repreculs rock-fowling at the Holm of Noss, a juecipitons insular rock, sepurated from Noss,

The Lolm of Nioss, Shetland.
one of the Shetlont Isles, by a chasm of G5 feet wile, and 160 foet deep, over which rones have been stretched, so that a cralle or sparred hos can be mate to bass along them, aftomting necess to the errascy smmmit of the Holm, where atew sheep now feed, and where innumerable sea-hirds make their nests.

FOWLS OF WARREN. I.Mot Coke says they are "the fortrilye, paial, rail, \&e."' "pheasant, woolenck, de., ame the 'mallard, heron, de.,' leaving the etcoteras without explamation (Co. Lilt. 233). Manwomb, again, lays it down that there are only two fowls of warren, the phoasant and the partridge (Danw. (1) $)$. In the Jhke of Devoushime 2 Lodge (7) and C: 36), it wis deeded that grouse are not birds of warren.

FOX, Cilamefs James, a celebrated Whig statesman, was the sccond son of Henry Fox, lirst Lord Holland, ly Lady Georgiana Carolima, eldest daughter of the louke of Richmond. He was born, according to Lord Juhn liassell's memoir, on the 2tth January 1749 (N.S.), and was educated at Eton and Oxford, spending his vacations on the continent in the gayest and wittiest circles of the French capital, and visiting Switzerland and Italy. Notwithstanding the irregnlar life which he led aren as a school-boy, he was very distinguished for ability both at school and college; and so high was his father's opinion of his talents, that at the age of nineteen he had him lronglit into parliament as member for the borough of Midhurst, a step to which he is said to have been further incited by the fact, that, even at this early age, F's energies had found an outlet in gambling and varions other forms of dissipation. Ilis preocity in viee, as well as in inteleetual development, is said to have been the result of the injudicions fondness of his very umprineipled but very gifted father. 'Till le attained his majority, $\mathrm{l}^{\text {r. }}$ prudently kelt silent in the House, but inmediately thereafter he appeared as a supporter of the administration of Lord North, and was rewarded with the othee of one of the lords of the Almiralty. In 17: 2, he resigned that office, aml the following year was named a colmuissioner of the Treasury. From that post he was dismissed, in eonsequence of a quarrel with Lord North, amd passed over to the ranks of the opposition. During the whole course of the Anveriean war, he was the most formidable opponent of the coercive measures which were alopted by the government, and the most powerful adrocate of the clains of the culonists; acting, to this extent at least, in accurdance with the views which for many years before had been urged upon the country by the great Lord Chatham, the father of his future rival Mr I'itt. The difference hetween them was, that whereas Lord Chatham urged eonciliation, in order to preserve the connection hetween the two countries, $F$. foresaw and foretold the mecessity and the advantayes of complete separation. In 1\%sa, on the downfall of Lorl North, F. was appointed one of the secretaries of state, which ollice he held till the death of the Marquis of Rockingham, when he was succeeded by the Enal of Shelburne, afterwards Marquis of Lansdowne. On the dissolution of the Shelburne administration, the North and Fox coalition was formed, and F. resumed his former office: lout the rejection of his India lill ly the IIouse of Lorls som after led to the resimatim of his government. It was now that Mr l'itt came into power, and that the long and fanous contest between him and F., who occupied the pusition of leader of the opposition, commenced. in 175S, he enjoyed a short respite from his public labours. Aceompanied by his wife, he visited the continnt, and having spent a few days at Lausanne, in the company of Gibbon, who was there eagaged in writing his famons history, he set out for Italy. The suden illness of the king, however, and the necessity of constituting a regency, rembered it umdesirable that he should be longer alsent from England, and he hastened back to his post. The regency, the trial of Warren Hastings, the French Fevolution, nat the events which followed it, gave ample scope to the talents and energies of F., and on all occasions he employed his influence to modify, if not to connteract, the policy of his great rival. He was a strenuous opponent of the war with France, and an alvocate of those non-intervention views which find greater favour in our day than they did in his. After the death of 1'itt, F. was recalled to office, and endeavoured to realise his doctrines by setting
on foot nerotiations for a peace with France, the results of which he dill not live to witness. He died on the 13th September ISvt, in his 59th year. In private life, Mr' F. was a genial enmpanin, kindly and sinecre in the eloser relations of friendshi], whilst his concluet to thoze to whom he was opposed in publie was generons, and free from every trace of malimity ar enmity. Lord John liussell, in the preface to his Memorinds and 'orrapondence, sjeaks of the singular eandour, boldness, simpheity, and kinduess of his character; and of lis oratorical powers it is enough to recorl, that lurke callech him 'the greatest delater the worh ever saw,' and Sir James Mackintosh, 'the most Momosthonim suc:aker sinee Demosthenes.' His remains were interred in Westminster Alber, so near to those of Pitt, as to suggest to Sir Walter Scott the wellknown complet

## Shed upon Fox's grave the tear, <br> 'Twill trickle to lis rival's bier.

FOX, (iEonge, the originator of the Socicty of Friends (q. Y.), commonly called Quakers, was lum at Drayton, in Luseestershire, in 1694 , and at an carly age was employed in keping sheop. Sulserneatly, he was apprenticed to a enuntry shoemaker; hut when ahont 19 yars of age, his religious impressions produced such a strom conviction in him, that he believel himself to lre the suliject of a sprecial Divine call; and abandoning lis nsual avocations, wandered solitarily through the country, dressed merely in a leathern doublet of his own makine, and absorbed in spiritual reveries. After some time, his friends induced him to retum lome, but F . stayed with them only for a short period, ame finally adopted the carcer of an itinerant religinus reformer. Ahout 1646, he left off attending chuch fur divine worship, but dil not scruple to intermpt the services when conducted by "professurs,' i. e. formalists, or jersons whim he helieved not to be menuine ("hristians. II is first efforts at proselytism were made at Manchester in 164S. 'The excitement caused was tury great, and, in consequence, F . was imprisoned for some time as a disturler of the buace. It may le proper to mention here, that his lealing doctrines ur convictions were the futility of learning for the work of the ministry, the presence of Christ in the heart as the 'inner light,' superseling all other lights, and the necessity of trying men's opinions and religions by the Holy spirit, and not lay the Neriptures. F. next travelled through varions of the midlaul counties, Derby, Leicestre and Northampen, (xhorting the peopile in pullic places to forsake all vicious practices, drmakemess, swearing, \&e., and to cultivate the Christian craces. Ile hanl is wimninf manner, resulting from his ext reme earnest. bess and simplicity of purpose, and made many converts. Ilis followers were tirst contemptnously ealled 'Quakers' at Derloy, in 1650, by Justice Bennet, for what reason is not exactly known, but it may he conjueturel that it possibly arose from the agitation exhibited in their speech when they believer themselves 'moved by the Iloly Ghinst.' In 1655, F. was lirought to London, and examined before Cromwell, who quickly saw that there was nothing in Quakerism to excite his aprehensions, and pronomeed the doctrines and the eharacter of its founder to be irreproachahle. Nerertheless, for some rears after this, $F$. hal a hard struggle with his f'uritan antagonists. In an age of dogmatism and fanticism, it was not to be expected that the half-mystical spirituaities and grotesque practical crotehets of the Leicestershire shoemaker could meet with any official toleration. F. was constantly vilified and frequently imprisoned by country magistrates. In 1669, he married the

lonly distimuished from dous, wolses, jackals, de.,
 in the fom of the section of : lens, not cireularly. This takes blace whonever the cyes are turnen to astrong lyht, and foxes are all nocturnal anmads. Foxes are allon watally of lower stature in pore portion to thatir hagth than the other Conide; they have a momblish hat, with a very ponated muyde, whort triansular cars, shomer limbs, and it bushy tail. They dir Jurruws for themselves in the arth, on take pussession of holes alrealy existme. 'They are famms for their cumane, which thery exhbit both in their artitiens for abtainins preve and for cecapine from danger. They feed on suall qualru]nals, hats, whes, de: some of them, however, also partly on froits and other vercetable substanees. The Common Fox (I', mpmons), a mative of most parts of Durone, is the only British species, and is still prety ahomiant in must parts of the comutry, although from many parts it would probably have been extirpated ere mow, whess it had been in some measmer [notected with a vaw to the sport of foxhunting. 'lthe commone fox is reddish brown above, white indeath; the outsine of the cars hack, is Wack line extembing from the inner angle of the eye te the month: the legs mostly hack, the end of the tail sumerally white, althond specimens sometimes overa in which it is gray, if even black. There ame at leist three varieties kinown in lritan, pretty wedl marked by diderence of size and form-the firmo. hoond toj heine more shember and longer-limbed, and the ('ur fise-irepunt in phand monish districts-beners sualler than the emmon varicty:

The Common Fox ( 1 utpes relleneris).
Other varieties occur in the north of Emrole. The fox has a rland under the tail, which secretes a very fetil suhstance, communicating to the whole animal its well-known smell. It hreeds once in a year, having usually four, five, or six young ones in a litter. Its usinal verice is a kind of yelp. Its senses of sight, howing, and smolling are very acote. lmumerable ancelotes are on record illustrative of its comming. 'The difficulty of setting traps so that they shall not be detected and awoded by it, is well khriwn. Joxes are sad to have heen ohserved atpeaching waterfowl by swiming slowly with a turf in the month, so as to remian concealed. A most trustworthy pren assureal the writer of this artiche, that he saw a fox apmotel a group of hares that were feeding in a fidhl, with a slow, limping mation, amd having his hem down as if ating chave, till he was near enough, by a sublen minh, tusecnre bery diflerent fomel. Foxes captured in hon-rosts have often fren known to smalate doath, ind to sulmit to lecing draghed about and bery mandy treated without is sign of life, till an oprortunity of escape presentel itself. When
they are driven to their holes, amd these are surrounder with traps, they not unferpuently shew such a just apprecintion of the danger, that they will cnilure starvation for days and even weeks rather than eome out. Fyen when taken young the common fux can hardly be tamed; amit very few instances are for recori of its shewing uven a little of that attachment to man of which so many animals are capalle, and for which the dos is so remarkable. The impobalility of any of the domestic races of dag being at all derived from the fox, is noticm in the artiols low. 'Whe Frach renar! appears in English in requert, the fomiliar appellation of the fox.-The scinth of Finnue promes foxes of smaller size thim the common fox, having the fur of the helly hack, recarlend hy some as a mere varicty, ly others as a rlistinct species ( 15 melenomentor). They are less carnivorous, and to thom some of the allusions and fables relate-as rif the fox and grapes, \&e.-which don nut accorl well with the habits of the foxes of liritain ame of Nopthern Emope.-The Himalay
 very similar to the rmmon for, lat of sulurior size amb hilliancy of colours. The fore is rich amb fine-The binek Fox of Nouthern Asia is alse Very similar to the common fox, but is entirely of a velvety lomack cobur, except the tijo of the tail, which is white; its fur is greatly estement, $\min$ is a high rrice, anol forms an article of "xpart from Kamtchatka to ('hima.-The Conl Fox (I alnery) of some parts of Europe, as switzerland and lavaria, is by some naturalists reqarted as ilistinet from the commen fox. It is of inferior size, more timiob, and less troublesme ; the tip of the tail is blatk.-. North America has several species of fox, of which the lifo Fox ( $\mathrm{I}^{*}$. iulras) very nearly resembles the common fox of Europe, hut is of rather larger size, has a shorter muzzle, eyes marer each other, and a more copiously hushy tail. Its fur is also lomger, finer, more limilliantly colnurol, and much mote valuable, forming a considerable article of expert from the fur countries; in which, as well as in Comala, and in the northern parts of the Cnitel States, this species is ahmulant. The clooss Fox is a varinty of it, distinguished by a longitudimal dark baml along the back, crossed by a transwerse hand wer the shonlders. The limrrow of this fux "at first melines flownwarls for fom or tive fect at an auste oi alout twenty-five degrees, it then inclines upwarts a little, whin is a security against imundations, and is empinuerl at a ilepth of alriut there or four feet from the surfare, until it raches a 1 wint where it is livited into two or threc eralleries.' Great mumbers of these foxes are annually tracked to their lurrows, and digegrel or smokel ont of them
 iomes) is the must ahumbant species of the sonthern states, extenuling, however. as far morth as "analla, where it is rare it is of a gay columr, varied with hlack, is alout the size of the common fox, lut not so Inkl, and sometimes ents regrtable suhstances, such as ears of maize. The sray fox exhilits not a little of that cunning for which the common fox is cetehratenl, and when pursumed by hunters and hounds, has been known to escape by getting upon the rail of a fence and running along it for simp listante, so that the seent was lost. This was on one oweasion clone on the newly-laid rail of a railrome devated alove a swamp. It is not unfregnent for the eray fox, when haral pressed, to take refuge in a tree, marticularly if one which has somewhat fallen from the perpendicular presents itself.- There are a numbace of other sperms of fox, Asiatic, African, and American; but the most deserving of notice is the Arctic Fox ( $V$. layopus), which inhabits the most
northern parts of Limrene, A sia, and America. It is very plentifnl in Iceland, feeting much on ptarmigans, and sometimes on young lamls. Great numbers are found on the shores of 11 bulson's Bay, particularly churing winter, and they have been shilesel tor migrate thither from still hure northern regimes; lut it has been ascertainel that this animal Sunds the winter even in the most northern regions that have aver luen risitel ly man, braving the cohd of Melville lslaml and Hanks's Lame, and finling abmelance of fond in the hares, marmots, pitarmigans, and other ammals which also remain ther". The Aretic Fox is rather smaller than the common fox; it is more densely clothed with a wolly fur, which om some parts is two inchis in lengti : the tail is extremely bushy; and even the soles of the feet are thickly covered with hair. The colour is Inre white in winter, at least in very colll climates; varying to a brownish er bluish eulour in summer. It is gregarious, and many hurrows are often found tugether. It is extromely cheanly in its latiots, anal is quite devid of the uffensive smell which lelongs tomost of the foxes; it is also much less enmane, and much more easily trappel, as well as mueh mure gentle and eapable of being tamed. Its flesh has been sometimes eatem by arctic voyagers, with a relish due to the extreme cold of the climate and the consequent ilcmand of the system for animal fond. Its fur is wot nearly equal in value to that of the real fux.
FONE, Jous, the martyralagist, was horn of respectable parents in 1517, it Benton, Dincrinshire. In 1.333, he entered as a student at Prasenose College, Oxford; in 1.335, he took his Pachelor's, and in 1.it3, his 17 aster's degree, aml was elected a fellow of Magialen Chllege. He displaved at an early leriod an inclination for Latin juctry, and wrote several phays in that language upan seriptural sulijects. Of these, the only one that remains, entitleal De Clristo Triumphonte, was rinintel at Lomdon in lisil, and at Basel in 15ifi, Svo, and 16, The religions movements of the times led him to study the great enntroversy between Popery and Protestantism, and becoming a convert to the principles of the lieformation, he was, duly 22,1545, expellom from his colluge for heresy. Ifis father heine deal, and his mother marrich acgain, his stepfather refused him any further ain, and he was, in consepuence, reduced to great distress. Fur a short time, he was employenl as tutor to the children of Sir Thomas Lury of Charlecte, Warmickshire, and afterwards was engaged by the Duchess of Liichmond as tutor to the chiliren of her brother, the Earl of Surrey, then in state prisoner in the Tower. In this eapacity he remained during the whole reign of Ehwarl Vi.. lout was never, notwithstanding Anthony ir Wonil's assertion to the contrary, restored to his fellowship at Maglalem. On June 23,1500 , hee was oriainelileacon by Ritley, Bishop of London, and preached the doctrines of the Jeformation at licigate. During the reign of \$lary, he retired to the continent. On the accession of Queen Elizabeth, he returned to England in October 15.n ; and in May 1503, he was inducted into the canonry and preilent of shiptom, in the eathedral of salishury. He also rnjoyel the living of Cripllegate, which he somn resigncil, amil for a year he helel a stall at Wurlam. In 157.5, when sime Dutch Anabaptists were condemnet to the flames in Lomlon, F. intercerled fur them with Qucen Elizabeth and other persons in authority, but without eflect. He wrote numerons enotrowersial and other works, but the one that las immortalisell his name is his IIstory of the Acts ant Monaments of the Church, popularly known as Fore's Book of Martyrs, the first $\mathrm{I}^{\text {art }}$ of which was published at Strasburg in 1534. Tho

firet English colition aphared in latio, in one wh. Filio. Sanetioned by the hislups, it was orlered, IV a canm of the - Lnelican convocation. to be finced in the hall of every copiscopal pabae in England, and has gone through imumerable editions. It is not a very critical work, as minht naturally hee supposed, and homan Catholies leny its trustwrothmess. F. dicel in 1557, in his Joth year, anl was huried in the chancel of st (riles's, "rippleqate, 1،mulan.

FOXES ANB POX-HUNTING. Tho law with rufornce to fox-huntime which is a matter of a fram deal of importanco in many parts of the country, sems to stamd thus in Jinglanl: "Though in general all persons whon onon anothers lands without permission are trespassers in the oge of the l.w, yet there are some cases where the trespass is sain for be justifiable,' says Mr l'aterson, the most recent writer on the sulject, and he quotes Blackstone's rictum t" the rifect that the common law warrants the lamting of ravenous basts of prey, as badgers and foxes, in anther man's lant, because the slestroving such creatures is sain to be profitalle to the fullic' (; Black. ('um. 212). Care must be taken, however, that no thamage be done heyond what is necessary for the fullic gool, for that is the croumd on which alno the leral character of foxlmatine ean lie maintained. It was fond, morewer, in the Earl of Lessex o. Capel (l Chitt. Game L. 144, that thonh pursuing a fox on another's lamb be justifiable, yet, if it take to earth, or to a lumse there, it is not justifiable to dir or hreak doors for it. In Sentland, where, from the character of the country, fox-hanting is often impossible, it never has become a national sunt to the same extent as in Eumpand ; and consegucutly, the rule that one is entithed to enter on the lands of another for the purpose of killing in fox, has been confiucd to those cases in which he is pursued simply as a noxious beast, and fox-hunting for sport without lave las becn heht to be pmoishathe as a trespass, and the trespasser helid liable for whatever surfacedamate he may vecasion. In Ircland (hy I and $a$ Will. IV. e. 82, s. 35), persons pursuing with honnts any fox, hare, or deer which has been started dsewhere on anther's land, are exempted from summary procectings for trespass.

## FOXGLOYE. Sce Digitalis.

FOXHOUXD, a kind uf dor much used in Britain for the sport of fox-hunting. It is not yuite so large as the staghomul, and is perbaps a mixed breel between the staghonnd or the bhodhame and the greyhoms. The colour is commonly white, with large patches of black and tan colome. Their sued and ferseverance are remarkable; they have been known 'to runhard for ten hous before they came up with and lilled the fox, and the sportsmen were either thrown out, or changed horsts three times.'

FOX-HUNTANG, from its exiting nature, as well as from the qualities of daning courage and cool ealeulation rerpisite in those who thoronghly follow and apreciate it, has long leen termed the king of lsritish national sports.

In Great Pritain, there are upwarls of 100 hunting establishments, if whirh ly far the greater proportion belong to the comntics sonth of the 'Tweed. Fox-hmnting establishments-which are in most instances supportad ly subseription, thomgh sometimes owned liy private gentlemen of wealth and influenee-aro organised and maintained at a very considerable ammal cost, the price of a sinclo prack of foxhounds sometimes amounting to several thousand guincas. Every establishment
is under the direct superintendence and control of ome experienced gentleman, the master, and under lim again rank the huntsman, whipers-in, carthstopper', kemnel-servants, \&e. A 'pack' is composed of from : 0 to 60 couples of homis, the mumber greatly deponding unn the frequency of lomingdays: thus, some paths lunt six lays, some tivo days, others four, and many only two days a weck; 30 couple of hounds is a gool arerage; theso we curefully rearel, fod, and otherwise atteured to. The master himself, as a matter of course, has the general superintendence of tho servants, homme, and horses; and in the hunting. tield is general director of the procedings. Next to him come the huutsman and one or two 'whippers-in' ('whips'). Tho hmisman, who is practically the most important personage in the fich, reguires to see that his hounds are pro$\mathrm{p}^{\mathrm{kr}} \mathrm{l}$ y managed and fed in their kemuels; duly led to the phace of meeting on hanting-days; and, what is of more consequence still, that they receive fair-play in the tieh, and tind and lamt their foxes in true style. The huntsman requires to be a man of great nerve and much activity: he should also have a good head, a clear ringing voice, a keen eye, and above all he must be a firstrate horseman, and know thoronghly every point in the country over which be humts. He has often to restrain heedless riders, and 'keep the field back ;' a duty requiring firmaess of character, with a puict and civil mamer. With these neeessary qualilieations, and haring so many responsible daties on his shonlders, he is treated with great respect by those for whom he prorides sport: he is incumiterl on the loest horses his master can prodnce, and may he said to condnct and direct the hunt from the moment the fox is fouml till the moment of its death-from 'find to tinish.'

The duties of the first whiper-in, thongh not so responsible as those of the huntsman, are still considerable: for instance, he takes a certain manarement of the hounds in kennel, assists in combucting the hounds to the 'meet,' and aids the huntsman in warions ways during the rum. His knowledge of the management of hommis, and of fox-hunting generally, must at the same time be such as to conable him to occupy the hutsman's place in an cmergency. 'The 'secoml whin's' prineipal duty is that of limging up and wiging on lagging hounds in the fiedd, by lashmer and 'rating.' In many linnts, however, it second whipper-in is dispensed with.

A consideralile range of comentry is necessary for the fall enjoyment of fox-hunting, the best boing that which is diversilied hy pasturage and plantation. Being a nocturnal feeder, the fox equits his lourrow or 'carth'-which is generally in a gorse bake, or a plantation or covert of underwoolduring the night, and returns to it in the morning, and this fact is taken advantage of by those who humt him for sport. The day anil place of 'the meet' are duly alsertisel, and on the might before the hunt, the coverts to be "llanon' next day are visited vither by a iluly appointed earth-stopper or by the gamekeeper, who, knowing that the foxes are from home, proceeds, spade in hand, from one hole to mother, filling them "ul with earth and brushwom as he gots. Thus, the fox, unon returning at dawn to his 'earth,' finds ingress denied, and so butakes himself to some neighbouring thicket, or to some menclosed cover of gorse, rushes, \&e., where he makes a temporary lair or 'kemnel.' When the earths have been carefully elosed, the earthstopure seturas home and informs the huntsman, or first 'whip', as to their number' and locality,
and that information forms a guide for the proceedings of the following day. (After the hunt is over, the earths are reopened, and as little trace as possible left of the work.) The hour of the meet' is usually ten or cleven oclock A.m., and at the appointed place assemble the whole held, including master, huntsman, whippers-in, hounds, and those gentlemen (and irequently ladies) who intend either to participate in the day's sport, or merely to see the 'hannls throw off.' When a covert is reached, the huutsman, ly a wave of his band, or a few familiar works, such as 'Lu in: en in there! good dous!' 'throws in' his hounds, following immediately after with the first 'whip.' 'The mounted gentlemen usually remain outsile, and take their directions as to stance, \&c., from the master, who from this time forward does his best to control and direct their move. ments. In fact, the master may be said tu have the control of the 'field'-that is, the ridersand the luntsman that of the honods anel hunt. The semul whip being posted at the covert sile, near where it is expecterl a fox may lurst throngh or 'break,' one or two of the more eager riders are sometimes permitted to jump their horses into the eovert, if it be large, to assist in the finding of the fox. Those who remain outside then prepare themselves for their work, and eagerly listen for the first token of the presence of reynard; this is betrayed by a slight but anxious whimper or whine from the 'elallenging' boundthat is, the hound (usually an old and exprienced one) that tirst perceives or 'hits' the scent of a fox -and is soon followed by others, who instantly rush to his side. The huntsman, if be be tolerably eertain that the game scentes is no other than a fox, at judicions intervals urges on his homels by familiar expressions, such as 'Yoicks, jomeks, have at him!' 'Push him up!' \&c, till the fox is fairly roused from his kennel, ant goes away. It not unfrequently happens while drawing coverts, that hounds will eome sudenly upon it lox, and scize him before le bas time to escape. This is termed 'chopping,' and is always to le preventer if 1 wossible. If the covert be very thick, a fox may leave bis kenal unperceived; and when he does su, he usually rums throngh or round the covert for a cunsilerable rlistance lefore Gritting it for the open fields. ILe may also 'run Lis foil.' lyy doubling back and forwarel on the same ${ }^{\text {noth }}$ or track, and thus possibly, hafle the hounts, even when they 'own his scent.' In large coverts, too, a fux frequently 'langs;' that is, fee romains in it for a long time before going away. The fersen who first sees the fox 'break cover,' or, in other worls, 'views him away;' should always allow him at certain 'law' lefore giving the view halloo.' as a fox will frequently torn or 'head back' into covert if ho hears any umusual noise at the instant of his yuitting it. When, however, the person of persons who are watching see that the for is really off, notice is instantly given to those within the thicket, and those without, by the ery of 'Hlou-y! hon-y! Tallyho! Gone away! Goxe AW-AY!!' upon Which the huntsman hlows his born to collect his hounds; the whiper-in drives out lagging members of the mel. Either sith his whip or liy some ery; the master restrains the mone impatient of the riders till the huntsman and homds have 'settled to' their fox; and then Le and the entire field join in the chase, and the first, and frequently the most exciting part of the day's proceedings has commenced -the fox has 'broke cover,' the hounds have been 'laid on,' and the ficld has entered on its impetuous "first burst.' A certain etiquette is, however, alsolutely necessary
in allowine the hounds and huntsman to get away first; but after that, cach rider, with a certain

Fou-hunting-' Cone away!'
deference to the master, chooses his own place in the hant, and does his best, indemmiently of his neichburs, to keep at a certain distance, not directly in thes line, but to one site and in the rear of the hounds. When a riller liaplens to ha near the pack at the first lurst, and gets a goor position in following them, he is said to 'get well away with the homis:' and if well monted and a skilful rider, lis chances of both viewing the hum and being 'in at the luath' are very consideralle. Amd now, as we have already sail, begins the grand excitement of the day; the fox being fresh, races away at tremendous speed, followed by perhilis mpwards of twenty couple of hounits at full ery. If the day is propitions (a 'soutberly wind and clouly sky' having long retainel favour), the scent of the retreating fox lies well, especially at first, when it is called 'burnimy' or 'breast high,' and is for many minutes 'owned' ly at least all the leading lumbla in the pack, thongh, Ierhaps, the njeject of pursuit itself is far aboad, abil out of sight; and away streans the bunt wor leelges, ditches, and gates, aemoss rivers, railways, arable land, and grass lastures, perhaps for several miles before a single durta weurs. Now, the foxhound hunts almonst entively by seent, and does not, like the greyhomi, depent uron the eye. The fact of securt failing, there. fore, at any time during the hunt, throws out the hownds, and prevents them from renewins it, matil the sent is recovered, or •hit wll. When the secent is 'burning.' hombls run alumst mute, thourch at tirst, and at intervals afterwards, they usually 'throw their tonsuts' pretty fredy. When all the homels are giving tongue, they are said to be at 'full ery,' and 'carry a grom heal.' the scent leing on such ereasions so thoronghly tiffused as to be felt or 'ownel' hreast high ley probally every member of the pack. Sometimes scent becomes so finint as to be hardly perecptible, and when this is the case, the enerry of the hounds abates considerably; they then rom with their heads elose to the ground, and are said to lunt a 'cohl' seent. Here, bowever, a little timely assistance from the buntsman is of the greatest moment in restoring animation to the pack. He waves his eap, hows his horn, and encourages his hounds by well-known expressions, to reneweal exertions. When, as frequently haphens from various causes, the scent fails cutirely-such as the for

FRiA'CTED, heraldically, signifiesbroken asunder.
FRACTION. In Arithmetic, a fraction is any part or parts of a unit or whole, and it consists of two members, a denominator and a mumerator, whereof the former shews into how many parts the unit is divided, and the latter shews how many of them are taken in a given ease. Thus $\frac{3}{4}$ denutes that the unit is livided into four parts, and that three of them are taken; and more generally $\frac{a}{b}$ denotes that the unit is divided into $b$ parts, and that of of them are taken. A fraction is called proper when the mumator is less than the denominator, and improper when the numerator is greater than the denominator. In Algelora, any guantity $\frac{1}{b}$ is called a fraction, althongh $a$ and $b$ are not necusarily representatives of whols numbers, as they would mave to be if the fraction be an aritlo. metical fraction. The algeloracal fraction $\frac{a}{b}$ just means that any quantity affected ly it is to be multiplided lyy a, am devided hy $b$. This detinition, boweser, through the ereater pencrality of algha, incluchs that of an arithmetieal fraction. The mules for the aldition and multiplication of fractions are the same in algona and arithmetic. Tu and two or more fractions tugether, we must bring them to a commen dromminatur, and ahd the momerators for a new numerator, and take the conmon denominator for the new Amminator: This if $\frac{c}{b} \frac{c}{d}$ he two fractions, then $\frac{a}{b}+\frac{r}{d}=\frac{a b}{b d}+\frac{c b}{b l}=\frac{a d+b c}{b d}$, the fractions being brought to a womon denominator ly (as a genmal rul.) multinlying each mumerator liy every denominator, "xceptsts own, and maltiply-
iny all the demominators for the eommon elemmimitor. To sulitract two fractions, we loring them to a conmon denominator, and sulbtract their mumeraturs for the new numerator. Thus $\frac{a}{b}-\frac{c}{a d}=\frac{a d-b c}{b l}$. 'Tor multiply two fractions tagether, the male is, to multiply the mumaturs together for a new numerator, and the demmators together for the new denominator. Thas ${ }^{\text {a }} \frac{b}{b} \times \frac{c}{d}=\frac{a t}{b, l}$. The reasons for all these rules are olsious. The rule of division is to invert the divisor, and proceed as in multiplication. This follows from tho consileration, that to divide is the inverse of to multigly, and that to divide by ${ }_{b}{ }^{\text {a }}$ must he the same thing as to multiply by $\frac{b}{a}$.
FRACTIONS, Continctid, if $\begin{aligned} & \mathrm{A} \\ & \mathrm{B}\end{aligned}=a+\frac{a_{1}}{\mathrm{~B}^{2}}$ and $\frac{b}{a_{1}}=b+\frac{b_{1}}{a_{1}}$, and $\frac{a_{1}}{b_{1}}=c+\frac{c_{1}}{b_{1}}$, and.... $\frac{l_{1}}{l_{1}}=m+$ $\frac{m_{1}}{l_{1}}$, and $\frac{l^{1}}{m_{1}}=n+\frac{n^{1}}{m_{1}}$, \&c.
Then $\quad \frac{1}{B}=a+\frac{1}{b+1}$

$$
\begin{aligned}
& \bar{c}+\underline{1} \\
& \overline{l+\ldots} \\
& \text {.... } 1 \\
& \overline{m+1} \\
& n+\ldots .
\end{aligned}
$$

This expression for the valuc of $\frac{A}{B}$ is called a continned fraction. If we consider the fractions (1) $\frac{a}{\mathrm{I}}$, $(2) a+\frac{1}{b}$ or $\frac{(a b)+1}{b},(B), a+\frac{1}{b+1}$ or $\frac{(a b+1) c+a,}{b c+1}$ $\stackrel{\ddot{c}}{e}$
formed by taking into acenunt parts only of the denominator in the continued fraction, we obtain a series of fractions converging to the valne of $\frac{A}{B}$. These convorging fractions are always approximating to the value of $\frac{A}{B}$, and are altemately greater and less than it. Thronghont the scries, the 1 st, 31,5 , 5 , 7 th, \&c., are each below the true value, while the $2 d$, 4th, de., are above it; or rice versa, according as the original fraction is improper or proper. It can be shewn that the successive converging fractions aplmach nearer and nearer to the true value of the contimed fraction. Converging fractions are of great use in the summation of infinite series.
In illustration of the above general statement, let
us take the numerical fraction $\frac{6935}{2154}$, which we first reduce to a continual fraction in the following manner: $\frac{6935}{2151}=3+\frac{482}{2151}=3+\frac{1}{\frac{2151}{352}}=3+$ $\frac{1}{1+\frac{203}{3}}=$ (by continning the same process) $3+1$ $4+1$ $2+1$ $6+1$ $5+1$
$7^{-}$or, as it is now
commonly written, $\frac{3}{1}+\frac{1}{4}+\frac{1}{2}+\frac{1}{6}+\frac{1}{5}+\frac{1}{7}$

Here the first convergent is 3 ; the sceond,,$\frac{3}{1}+\frac{1}{4}$ $=\frac{13}{4}$; the thirl is $\frac{3}{1}+\frac{1}{4}+\frac{1}{2}=3+\frac{2}{9}=\frac{29}{9}$; and finding the other converyents in a similar manner, we have the following approximations to the value of the original fraction:

$$
3, \frac{13}{4}, \frac{29}{9}, \frac{187}{58}, \frac{964}{209}, \frac{6953}{2151}
$$

The differences between the successive convergents aul the original fraction are,
$\frac{6935}{2151}-3=\frac{482}{2151}\left(\right.$ being less than $\left.\frac{1}{\times 4}\right)$,
$\frac{1.3}{4}-\frac{6935}{21.51}=\frac{203}{5604}\left(\right.$ being less than $\left.\frac{1}{4 \times 9}\right), \& c, ;$
and in gencral the difference letween any convergent and the rriginal fraction is less than a fraction $=$ 1
denom. of eonvergent $\times$ denom. of conv. next greater; cunsequently, the diffirences grow less as we proceed, owing to the denominators of the convergents always increasing. If, by actual subtraction, we find successirdy the difference letween each convergent and the original fraction, we shall also find that they are alternately greater and less, or less and greater, aceording is the original fraction is proper or improler.

FRACTIONs, Vansuing. In some algelbraical fractions, the substitution of a partieular value for the unknown quantity will make both the numerator and denominator of the fraction vanish; such fractions are called ranishing fractions. Thus the fraction $\frac{x^{2}-1}{x-1}$
assumes the furm $\frac{n}{0}$ when $x=1$.
The ascertainment of the value of such a fraction for the particular value of the unknown quantity which gives it the form $\frac{n}{6}$, may in all cases be effected by a general methon furnished by the differential calculus. But frequently that value may be determined $\mathrm{h}_{\mathrm{y}}$ simpler means, as the form $\frac{n}{i}$ arises from the existence of a factor common to both numerator and denominator, which beeomes zero for a particular value of $x$; if, then, we can discover this factor, either by finding the greatest common measure or othervise, and divide it ont, then ly substitution we olsain the value of the fraction enrresponding to the particular value of $x$. Thas, in the example given, we find that looth terms are divisible by $x-1$, so that $\frac{x^{2}-1}{-1}=x+1$. Therefore, when $x=1$, and the fraction lecomes $\frac{f}{4}$, its value must equal $\because$. This is an example of the arydication of the methot of Limits to the determination of the value of such a fraction, for it is dear that for every value of $r>1$, the value of the fraction is $フ \mathscr{2}$, and contimually approaches 2 as $x$ approaches 1. Much discussion has taken place as t" whether vanishing fractions hare, properly speakingt yalues or not; hut this is not the place fur notieing speculations on the sul,ject. See Linets, Theory of; and Nothing, and lisfints.

FRACTURE of a bone may he the result of accident, museular action, or disease. The lung hones of the limbs are more subject to the latter. two causes than those of the bead or spine. Predisposing causes to fracture are frosty weather, old age, eancerons disease, a morbidy lorittle condition called frayilites ossium.
some bones, as the kucepana and heel-bone, are liable to give way from sudfen contraction of the muscles which are inserted into them. The subjeet of the injury then falls, and attributes the accident
to the fall, whereas it is the reverse. A modical man, sume few scars aso, awoke with a fit of cramp, and almost immediately his left thing-hone lroke with a suap. It reunited in the nsual time. The sufferer from cancer of low standing, sometimes feels a bone give way under no special strain, 1n such eases, there is selfom any attemp,t at repair. The bones of ald people are laittle from the excess of earthy materials (see ToNE), and so readily give way. The bones of the fechle patient, with fragilitas or mollities ossium, are soft and friable, and when examined, are found saturated with a greasy substance.
Thore are some persons who sem lialle to fracture withont any such reason. Professur Gibson of Ameriea mentions a boy who, thoughs apprently healthy, had bruken his eollar-bones cimht times, his arm and forearm, while his leg and thigh were broken if he bat tripped his foot on the carpet. An ofl lady once broke both thigh-bones knecling down in church. There is one predisposing canse to fracture fortunately now lut seldoni seen-viz., scurve. Not only did it make the lones brittle, but, is was seen in Lord Auson's expealition, which was manned chietly liy pensioner:, old fractures again beeane disunited.
Repair of a broken Bone-Of course, as the bone lies in the midst of soft parts, any injury to the one must tear the other, and cause an infusion of blood ; but the latter is speedily ahsorbed, and is of no service in the process of repair: After the first excitement bas passed off, a thuid is etfused around the fragment, which in a short time beconcs converted into bone. The amount of this new material depends unon the position of the fragments; should they be far aprart, or, as it is technically termed, riding, then a muth larger quantity of new hone is thrown out. We see this in animals to such an extent that the materials for relair, ol' 'callus', may be divided into two separate parts-a provisional callus to act as a wrapper to the bones until the fermanent callus, or that which mites the ends, however far apart, becomes sufficiently hard: then the prorisional callus, being no longer necessary, is removed by absorption.

Symptoms of Frocture-A broken himb hanes lonse, and is as a yencral rule, no longer under the eontrol of the inuseles, which, however, are pricked by the broken cats of lone and stimulated into painful spasms, which still further displace and deform the limb. Shoula there be any doult, the limb may be carefully raised, and tumed wently from side to side, when a preculiar rimgh fueding trented mopitns removes all doubt. Each hone, howerer, when broken, exhibits symptums deeuliar to itwelf, and reriuires a separate treatment.

Fractures are divided into Simule, when there is no wound in the skin which communicates with the fracture: Compratel, when there is such a wound; Comminuted being pretixed to either of these terms when the bone is broken into several pieces; 1 mpacted, when one fragment is driven into the nither; and Compticuterl, when a neighbouring juint or large blumb-ressels participate in the accifent.

Treutment if Fracture.- lieplace the framents as near as possille to their fonner positions ly gentle extension, retain them in place by sulostituting an ceternal rigid skeleton, made of any unyididing material which will be firm enough to resist the spasms alrealy alluded to, but is mot fastened with very great tiphtness to the limb. rplints are generally of wond in pasteloard ; lut of late years gutta percla has leen much used. Ta simple fractures, it is uften sufficient to adapt a bandage to the limb, which will harden obelrying, and form a shell for it; for this purpose, starch, dextrine, and ihaster of

## fledghtila, sestinwberey.

FRADIE, in Garlening, the corering of any kint of hatherl, flued jit, on coll $j^{n t}$, used for the cultivathen of flants not sutficiently har ly for the area air. Frames are of rarions materials, lont fenerally of wowl wr irn amp glass, and are mande in one piece or in saslees acemding to the size of the hotbet or pit.

FRAME-IRIDGE, a lisige built of timbers framed tuecther in such a manner as to obtain the gratast tussible amount of strength with a given Guantity of material.

The fumbanental prinempe won whelk all sued construetion is hased, is that the fimbers shall bee so armange that the weight fut uron them whall exert a pullinit or a crnsting strain, instead of a transwerse stram, am, if lassilhe, that the $^{\text {and }}$ Ir atest strain shall act as a direct pull in the dircetion of the tiloses of the womb. The ennstructinn of a frame-hriten is very similar to that of a ronf, cxecpting that in the bridee a comsideralke mitward throst um the abratments is generally fermissible, while the walls of a house will

Fis. 1.
mot stand this: ame that for the brikler a mealy lewl way on the top is desmble, while tor it

 strain u"m he and ad, as well as upn the urpry timbthers and that thee man smpmert is in eth, which munt be tom anmaler lefore nd and lie can be bent ar disphecel tor any emsilerahlo extent.
 mastmetel in 18,5 loy dimbenmann, a village "Hpenter, was hailt exatly in the manmer of a row with a horizontal prithway superadidel. It
 "ither $17:-1$ feret span. It was merely laid upen the pions, and diel mot abut auninst them to exert any outwad thrust, as will he seen by fig. 2. The

Fig..
weight on the lridge is transmitted by the oblique herms, which by analogy we may call rojters, to the tie-beam ib, where it exerts a horizontal fulling strain. These rafters are framed into the tic-heam so as to abut firmly against it in the same mamer as loof-rafters (see lioof). This kind of frame-lridge is very common it Switzerlami, where timberobrides abomel: and it has doubtless rricimated from the fact, that most of the liridges have heen built ly the local carpenters, wha are aceustomed to the construction of roofs of consilerable span fors the commolions spluare-built wooden cottanes with werhangine roofs, so eommon in that conntry. Frame-hridges of more complex structure are srinetimes built ; in sume of these, the timbers are framed so as to prosent an archell form. In these cases, the structure is very similar to those deseribed and tigured muler Cestenivg. 'The serimus defect of all such binges is their lialility to decay from exposure to moisture, \&c., especially at the juints, where water is apt to lolke and remain, from want of free circulation of air to evaporate it. In the larige of Shatf hansen above described, it was fomm that when it had stood but 26 years, the oak-beams, where they rested on the masonry at a and $b, 1 \mathrm{li} .2$. were roticul, and the frames began to settle. This was remedied ly a carpenter mamed Gunder, whe raised the whole structure upon piles ly means of screw-jacks, and replaced the decayed woml. Deans shomld be alopted to ahmit the free circulation of air in thase parts where the timber rests mun the masomy, and to prevent water from settling in the timblur joints. The covered brilges of Lucerne and other parts of Switzerlam are well kown as opjects of special interest to thurists, when nemally imagine that the roofs are made for the comfort of travelers, lout their main object is the preservation of the hridge.

FRAMING, the jointing, putting tonether, or buhbing up of any kind of artificers work. The framing of timber gencrally is described under Chamixhr, and special kimes of framing umber
 Thase limps, de. In such trades as mathematical, "ntical, philusnthical, and other eomplex instrumentmaking, the workman who does flat-filed work, and fits all the ports. and puts the whole instrument tosether, is called the frumer, and his work framing.

## FRAMLINGILAD-FSANCE.

In the watch-trade, the man who frames all the parts together, annl buitls of the watch, is called a finisher, and his work is called timishing, though it eorresponds with what is ealled framing in other trades.

FLLA'MLINGHAM, or 'Strangers' Tuwn' a town in the east of Sulfolk, on the left lank of the Ore, I 4 miles north-north-wast of $I_{\text {pswich. It con- }}$ sists of a large market-place, from which a fow strects irregularly branch out. The church is built of black fliat and stone, and contains the monnments of Thomas IIoward, third Duke of Nomfolk, and of his cluchess, anil of the unfortumate Henry Howard, Earl of surrey, and of his comotess. Here are the remains of a castle with thirtuen sfinare towers, where Qucen Dhary retired after the death of her brother, Edward TV. line (1871) 2069.

FRANC, a French silver coin and money of aceount, which (since 179., when it supplantel the live Tournois) forms the mit of the French monetary system, anil has also been alopitea as such by lielgium and Switzerland. The frane is comed of silver, wine-tenths fine, and weinh five grammes, its value being abut 9?f. Ohe pound storling $=2.2$ francs. The frane is clivilet into 100 centimes, lint the ofd division into 20 sous is still mate nse of in common life. There are in France silver eoins of $\frac{1}{4}, \frac{1}{2}, 1,2$, ant 5 francs ; and goble pieces of 20 and 40 francs. Italy has also adopted the Freneh money-system, only that the frane is called Lira mova.
FRANCAVI'LLA, a town of Italy, in the province of Otranto, is situated on an elevation 22 miles sonth-west of Brindisi. It is well built, has a college, three hospitals, and several convents; has manufactures of woollens, cattons, and eartlyenware, and, with its dependent villages, has a population of 15,300.

FRANCE, the most westerly portion of C'atral Europe, extends from $420^{\prime}$ to $51^{\circ} 5^{\prime} \mathrm{N}$. lat., and from $8^{\circ}$ 15 E. long. to $4^{\circ} 5 t^{\prime}$ W. long. It is bounded on the N. liy the Chanal and the straits of Dover, which separate it from Englant, ly Belginm, the grand duchy of Luxcmbourg, ant the Rhenish provinces of I'russia: on the E. by the newly annexed German provinces of Atsace and Lorraine, by several of the Swiss cantons, and by Italy: on the s. by the Mediterranean and the elominions of Spain, from which it is seprated by the l'renees; and on the W. ly the Atlantic (the Bay of liseay). The greatest length of $F$, measured from Dunkirk in the north to the Col de Paleuctes in the south, is about 620 miles; and its greatest breudth, from cast to west, measured from the new lomalary line in the Tosges to Cape St Matthien, in Finisterre, is abont 5 ăt miles. Its circum. ference, inchsive of sianosities, is estimated at nearly 3100 miles, or 5000

| 1872, | . . . | 36,102,92L |  |

The techine of population between the census of May 1 S60 and of May 1572 is $1,964,973$, of which $1,597,219$ is the to the loss of the different territories ammexd by conquest to the German empure. The remainler is lue partly to losses in the war, amd partly to an absolute deerease in the purnation of 7: deprartments, no increase being preveptihle in more than 13 of the present 80 departments of I .

Coust, Islemels, and. Fiontior.-The north-norlhwest coast is generally imegular, inlented with numerous hays, the principal of which is the Bay of St Malo, the archipelago of Brehat, \&e. The west-south-west coast is more lofty and precipitous, and is interspersed with isolated roeks and promonturies; while somth of the Loire it is low, and limed with salt marshes to the foot of the Pyrences, where it again assumes a rocky character. Here lie tho islands of Tshant (Onessant), Delleisle, Noirmontier, Isle l'Yen, lie, Oliron, de. The coast of the Mediterranean, which is broken by lagoons or shore-lakes, is low till it has passed Toulon, after which it becomes boller. 'The only islimes off the shore are the Llyeres, near Tonlon; the larger island of Corsien (1. \%.) Jies north of Sardinia. The Mediterramean here forms two bays or gulfs, as the Gulf of lyons and the Gulf of Genoa, which belongs omly in part to France. The land frontiors of F . are formed on the sibe of Spain ly the l'yrences: un that of ltaly and Switzerland, liy the Nips and Inra chain; on the north-ast, the frometier line is umpretected by natural bomadaries, and since the loss of Alsace and Larrame is no longer defented, as before the war of $1870-187 t$, by strong fortresses.
$\because$ Pleims.-The ehief plains are those of bargunly, and of the oceanic district, embracing the lower busins of the Seine, Loire, ant Garome. '1hem are fond deat mountain chains belonging to france-
 territury from Span ; the Cevemo-bosman ranese, furmerl of the Cevennes (o. v.), rumning east and wat letween the lihone and loire, and the Vusges, rumbing north and south between the Moselle ind the new bonmelary line ; the Alps (op.v.), whieh sefratere the Swiss territury from the provinees of

Savoy and Nice；and the Sardo－Corsican range， which helongs，as the name implies，to the islands of Sardinia anil Corsica．The highest peaks in the J＇yrenees are the Maladetta and Moat Perin（ 10,856 feet and 10,994 fcet）；in the（evenno－Vosgian range，the greatest height（the Willlerkalm）does not greatly exceed 5000 feet．The French portion of the Alps now inclules several of the highest mountains and most clevated passes of the range， as．Munt Blane，15，54t feet；Mont Iseran，13，272 feet；Mont Cenis， 11,457 feet；and the pass of Little St Bernard． 7190 feet，\＆e．In Corsica，the highest peak rises to an elevation of 9000 feet．The grand water－shed of $F$ ，is the Cerenno－ Vosges chain，which determines the direction of the four great rivers，the Scine，the Loire，the Garonne，and the Rhone；the first three of which flow north－west into the Bay of Biscay or the Eng－ fish Chamel，and the fourth into the Ginlf of Lyons．Besiles these，the more important streams are the Moselle，Mense，and Schellt or Escant（all of which soon leave France，and flow into the Netherlands，or Germany）；the Somme and Orne （belonging to the basin of the Seine）；the Vilaine ant the Charente（belonging to the basin of the Loire）；the Oise，the Aube，the Come，and the Marne，which are the chief allluents of the Seine； the Sarthe，the Loiret，the Allier，and the Alaine，of the Loire；the Dordogne，the Lot，the Tarn，and the Allour，of the Garonne；anil the Saone，the Isere， and the Durance，of the lihone．

The entire extent of river navigation in F．amonnts to 5.500 miles，or $\$, 960,000$ metres，while the 99 larger canals，which have been constructed either to connect these rirer－courses or to sumply entirely new channels of water－communication，extend over a length of 2900 miles，or $4,700,000$ metres．The most important of these works are the eanals connecting Nantes，and Brest，and the Fhone with the Fihine，and those of Berry，Nivernais，and Bourgogne．F．possesses only one lake of any importance，Le Grand－Lien，a little to the south of Nantes，which has an area of about 14,300 acres；lut the country abounds in salt marshes or ponds，more especially in the districts of Gascuny， Houssillon，and Languedoc．

F．is peenliarly rich in mineral slnings，of which there are said to be nearly 1000 in use．Of these， more than 400 are sitnated in the group of the Pyrences，where there are 03 estalilishments for their systematic nse．It is estimated that there are，morcover，fully 4000 springs not hitherto employed．

Giologi，dr－F．presents a great varicty of geologial formations，but althongh we meet with an almost complete succession of all the stratified and non－stratifien formatims，they are distributed with great inerguality．Thus，for instance，while nearly oue－third of tho soil is composed of tertiary formations，a mere fractional part only is male nip of coal－beds．A heit of pinary rocks，forming the skcleton of some purtions of the Vosges，Alis， and Pyrenees，add of the great plateaux of Brittany and La Vendee，encireles the great central basim in which rises the voleanic formation of the moun－
tains of Auvergne，with their extinct craters，lava－ streams，\＆c．The slaces between this external breast－work and its volcanie muclens is oceunied by secondary and tertiary formations．Alluvial deposits are met with in all the valleys，but they oceur in extensive beds only in the neichlourhool of Dunkirk and Niort，and on the borders of the Mediterranem．Accorting to M．Maurice Block＇s estimate，the physical anil agricultural character of the soil of $F$ ．may be comprised muder the following heads：

|  | ncetares． |
| :---: | :---: |
| Mountainous districts，heaths，and commons， | 9，944，839 |
| Richl land．．． | 7，276，363 |
| Cualk or time districts， | 4，785，197 |
| Givavel，stony，and sandy． | 15，451，413 |
| Clay，matray，miscellaneous， | 9，807，587 |

The same writer further sublivides the soil of $F$ ． aceording to its actnal cmployment under the following heads：

Chinate－F．possesses one of the finest elimates in Eurne，although，owing to its great extent of area，very consiturable diversities of temperature are to be met with：thus，for instance，the north－ east parts of the country bave a continental，and the north－west parts an oceanic climate，resem－ lhing those of Cermany and Great Britain；while the Mediterranean districts are exposel at times to the ravages of the burning wints which have massed orer the deserts of Afriea，and to the lestructive north－west wind known as the mistrel， which often dines great injary to the fiehls near the mouths of the Chone and Var．The mean annual temperature of different parts of $F$ ．lins been estimated as follows by Humbolet ：Toulon， $62^{\circ}$ F．；Marseille， $59.3^{\circ}$ ；Burleaux， $56^{\circ}$ ；Nantes， $55.2^{\circ}$ ； Paris， $51.2^{2}$ ；Dunkirk， $50.5^{\circ}$ ．

Prorlucts．－－Oi the vegetalle morlucts of F．，which， from varied climatic and gevgostic relations，are necessarily characterised by great abmmance and diversity，the must gencrally cultivated are the cereals，the vine，chestnuts，olives，culimary fruits and vegetal）les，hops，beet－rout for the manufacture of shgar，thataceo，matler，chicory，thax，\＆e．In 1802 ，the yiell of wheat in F ．was 110 millions of hectolitres，the maximum annual quantity as yet on reeord．During the last 50 years，the import－ ation of cereals has so far exceedel the supplies for howe consumption and expurtation，as to lease $F$ ． the loser liy $\$ 50$ millions of frances．The cultiva－ tion of wheat has andually incrased during the last fifty years，but that of rye，barky，anl maize has exhibited little variation：while the growth of potatues has been most cotensively aurmenterl daring the sime period．The following table shews the ductuations to which these alimeutary sub． stances have beca sulojected：

|  | $\begin{aligned} & \text { 1\$15. } \\ & \text { Hectaren. } \end{aligned}$ | $\begin{aligned} & 1830 . \\ & \text { Hectares. } \end{aligned}$ | $\begin{gathered} 1845 . \\ \text { nectares. } \end{gathered}$ | $\begin{gathered} 1 \mathrm{S63} . \\ \text { пectures. } \end{gathered}$ |

 than lo rearal on which the majnity we lut, and the smatl mumber of the great lanifowners who wate on thuir estates, have hithorto tomided to What the pemerss of arriculture in France. Auri-

 ami the are now nexty whe thmand agrienltural asenci tions in hationt prots of France.

The manufacture of susar from bect-rent, which tak ite origin durine the Lreat wars of the canty part of the century, las heng paseconted with math rimolr llurime the last in sears, and about lial mallions of kilugrammestare thatally manufactured. Since the aprarance of the vine-tisease, lecet-ront has luen extensively amphese in the manufacture of alcohn! and in 14. amonterl to $4: 3000$ loctulitres. The cultivation is almost limitel th the north and east; hempand flax are erwan whetly in the northern, lat also in the sumbenstern departments. The entire promecthon of hamp was estimatel in 1542 at 67,507,070 kilo rammes, woth shas 2,300 franes: and that of Hax at $36,47,500$ bilogrames, worth $57,507,400$ francs. Since that period, there has been little dithirence in the home production, but an enormous increase in the importation of fureign flax and hemp; the averace amual value of tlax, for the perimi lwetwen 18.7 and 1866 , being 46 millions, and of hemp $S$ millions of franes. The cultivation of the mulbery-tree derives importance from its larime on the prodnction of silk. In 18.85 , the department du (fard had monopulised nearly hali the culture of these trees, which in its augreqate amome has continned unchanged. From its connection with the malherry, we here refer to the prometion of silk, which beran at the opening of the lothe., and which in 1700 had reached such vat dimensiuns, that the produce at that period was alrealy 63 million kilogrammes of cocaons, wonth $16 \frac{1}{2}$ million francs. Since that perion, it has exhihited ereat variations. From 1840 to 1853 , the prounction contimued steadily to increase from 17 to ef millinns of kilngrammes; hut the diseases to which the silkworm has been lialle since that periol have relluced the yiell of silk to so great an extent, that in 1857 it searcely amounter to 7 millions of cocoons. Naw silk, since the abatement of this disease, has acrain assumed its place aumen the chivef sources of industrial wealth in F .; aul. besides the chormous quantity consumed in lome mamuactures, the annual exports fur the parim between 1857 and 1866 amounted on an averace to 69 millions of francs.

The vine has, from a very early period, coustituted whe of the principal sources of the agricultural wealth of France. The choncest wines are grown in the limidnis, Purgundy, and Champague, hut some cacellent kints are proiluced on the banks of the Lure, and in sump of the southern departments. The breaith of soll devoted to this cultire fluctuates, lut may lue stated at about $2,000,000$ hectares. The mean prohnce for every hectare was, in 1785 , 21 hectulitres $\div 1$ litres; in 1529,27 hectolitres 20 litres: in 1850, 32 hectolitres 35 litres. In recent timus, the fungis known as the oidium, which has attackel the vine, has inflicted sneh serions damare on the plant, that in lsint (the worst year), the hectare yindmen 5 hectulitres, instead of the average guantity of $2: 3$ hectolitres. The following talle will show some of the anmal yiehs betwen the yars 1sus and 1569:

[^3]

The average yearly produce of the vineyards of F . is estimatel at alout 50 millions of hectolitres (ahout 1000 millions of esallons). Of this, about sth is mate into brandy, F. consumes nearly all the wine ratisel on her soil; the ammal expents being on an average little more than 2 millinns of hectolitres, valued at almut 218 millions of francs, for the years letween 18.37 and 1 sibi the latest previod in regard to which we possess otheial information.

The principal forest-trees are the chestnout and beceli on the eentral mountains, the oak and cork tree in the Pyrences, and the fir in the Landes. The destruction of the national forests lirs been enormons within the last two centurics, but measures have been taken in recent years to plant wool, in order to protect those monntain slopes which are exposed to inundations from alpuine torrents, and to provide a supply for the ever-increasing demand of woul for purposes of fuel. About one-seventh of the entire territory of F . is still covered with wool. Turf taken from the marshy lands is extensively used, more esprecially in the rural districts, for fuel.

Animals.-F. is not so well stocked with domestic animals as her great resources might warrant us in assuming that she ought to be. During the 50 years intervening from 1512 to 186. , the numbers of horned cattle have almost douhled in France. According to the census of 1561 - the most recent in regard to animals-there were in F. $3,312,037$ horses, 518,000 asses, 830,000 mules, $12,733,000$ homed cattle, $30,356,100$ sheep, $5,500,000$ swine, and $1,650,000$ goats. There were, iccorting to the Statistique Alyricole for 155S, about 3 millions of bee-hives, valued at rather more than of millions nf franes; the mean annual returns are, for honey, $6,670,000$, and for wax, $1,62(1,0104)$ kilogrammes. Poultry constitutes an importint item of farmproluce in F., estimated at $45^{1}$ millions of francs; white the eggs and feathers yiell 35 millions of francs. The wild anmals are fast diminishing from the son of F.; the lynx is ravely seen, even among the higher alpine regions, but wolves are still numerous in the monntanous districts of the central departments; while the chamois and widdgoat, as well as the marmot, crmine, amd hamster, are foumd among the Pyrences, $\mathrm{N}_{1} \mathrm{~s}$, and Vosges. The wild-boar, roebnek, fox, squirrel, polecat, and marten are to be met with in the wools. The red and fallow deer are scarce; hares and rablits aboumb, and game generally is plentiful. 'The wanton destruction of small (simging) hirls having been found to he conducive to the excessive increase of noxions insects, stringent mumicipal enactments are now being put into force for the protection of those birils.

Fiwheries.-The French government expents hetween threc anl four millions of francs annually in aiding those engaged in the great fisheries. The value of the exports of fish from F . ( 12 millions of franes) is little more than half the value of the imports. There are no official reports of river and other fresh-water bishing in F., or of the minor fisheries earried on along the consts, which cemstitute the prineipal means of wenpation and support of the majority of the local popalation. lyilchards and mackerel are caught in large ymantitics "ill Nurmandy and brittary. The west coasts have extensive oyster and mussel lods; tumnies and anchovies are causht on the shares of the Mediteramean. The following table shews the condition
of the principal banches of the lishing-trade in ISTO:

Mineral Products.-The chief mineral products of F. are coal and iron, in the exeavation of whieh nearly $2.0,000$ men were amployet in 1868 , Although $F$. is not rich in eoal, it possesses several very considerable eoal-beds, which are situatent principally in the east-south-east and north. The supply hitherto has not equalled the demand; although in 1565-the latest perion determinedit ruse to the cnomous amount of 1 az millions of quintals. Notwithstanding this home-suplly, it was found neecssary to import 77 millions of quintals to meet the increased ammal demanil, which, before the late war, han risen aluse $\because 00$ millions of quintals, while in 1592 it was still muler 190) millions. The iron mines of F. are of excellent quality, but their distance from the fuel necessary for the working of the mincral, renders then of relatively small value. In 186s, there were 150 mines in operation, from which $: 1 \frac{1}{2}$ millions of qnintals were taken; more than half of this quantity being ohtained from the five departments of Hantc-Marne, Haute-Saône, Cher, Moselle, and Norl. F. imports iron from Switzerland, fiermany, Belgiam, and Englanel. Argentiforons galena, a little silver and goll, eopper, leal, manganese, antimony, and tin oceur, but hitherto their vorking lass not proved very productive. :The department of Charente-Inferieure yields the larest amount of salt, the mean annual produce being $1 \frac{1}{2}$ million of duintals ( 2 millions of francs), whieli is fully one-third of the entire ammal produee of the whole country. F. derives about 41 millions of franes from its cuarries of granite and freestone, its kaolin, marbles, sands, lithographie stones, millstones, \&c. Granite and syenite are found in the Alps, Vosges, Corsiea, Normandy, and Burcunly; porplyyy in the Vosges, and basalt and lava for parements in the mountains of Auvergne. Marble is met with in more than 40 departments; alabaster oecurs in the Pyrenees; the larsest slate-quaries are sitiaterl near Cherlourg and st Lio.

The following list gives an approximative estimate of the value of the chief $p^{\text {roducts }}$ of French industry:

|  | Nillions of Frase |
| :---: | :---: |

Decupy $2-6,000$ perzons. Rheims stands conspicuous for its merinos an! line flanuls; Amiens and Naney for their fine printed womlen grods; Lodeve anil Elbouf for army eloths. filoves are made at Frenoble, Paris, de. The best earpets are made at Aubusson, Ableville, and Amiens. Paris is the seat of industry for some of the most eostly faluries, as (inbelins tapestry, shawls of great value, wateles, elocks, articles of erte, carriages, philusophieal instruments, \&e. Serres stands unvivallent for its chima and glass. St Gobain and st Quirin manufacture lorking.glasses of the largest size.

The trale of F . is inferior only to that of Encland and the United States. The great emprinms of trade are Paris, Lyon, St Etienne, Lille, Rheims, Nimes, Toulouse, St Quentin, Orleans, Avignon, Montpellice, se.; and the most active maritime jorts are Marseille, Cette, Hawre, Durdeaux, Nantes, Louen, Calais, Dunkirk, Bonlogne, Dielpe, \&e. These centres of trade have all suffered at different perions during the present century, from the political disturbances under successire govermments; but notwithstanding these drawhaeks, the commereial aetivity of the country lad made rapid strides within the last 30 years bedre the war of $1570-$ 15:1. The following tahle sluews the condition of trale during four years of the old monarchy:

While the rate of this progress during five years preceding $15^{-2}$ has been as fullows:
Years..

The transit trade of $F$. is effected by maritime navigation between foreiga and licach prorts, by enasting traffie, ar coboteye, between various Freneh ports, and loy railways. The merchant navy, whieh has incriased extensively of late years, numberel, in 1sio, exclusive of small tishing-vessels- "bateanx de la preche côtiare'-1.5,728 vessels, having a tomnage of $1,0-t, 654 ;$ of the latter number, 154 were steamers of 142,919 tons anl 57,523 horsepower. The cabotey", or internal ant coasting traffic, is a great source of fimancial wealth to the state, to which all rivers and canals belong. There is a length of $1: 3,150$ kilometres arailable for inland navigation in Franee, but, according to oflieial reports, three-fourths of the entire traffie is concentrated upon 1 Sou kilometres of this distance. Of this mumber, $831^{\text {rer }}$ ecnt. belonged to the ocean 1wirts, and 27 per cent. to the Mediteranean.

Ruilurcels, de-Aecordiner to the latest official report for Fecember 15:1, the railways in operation measure 29,500 kilometres, or about 14,000 miles. With the exception of less than 200 miles, the railways of F. are hed hy six companies, which are muder the superintendence of the state, from which they reccive the frllowing subsidies as detined by the budget for 1573:

The tutal receipts if all the lines were, for ISas ,
473

## FRANCE

:384, 60, 400 franes ; and the total number of passen grers conveyed by mall, $37,4 \pi, 298$. In 1565 , the number was $81.533,061$; and in 1809 , the latest jeriod for which any return is published, $111,164,284$. liy a clanse in the treaty of 15il, the whole of the lines of the lastern Cumpany in Alsace-Lumaine, about TOO kidometres in length, were solul to the imperial government of Germany for 32.5 millions of franes.

The ereation of the first highroads in $F$. is referred to Philippe Augnste ; annl their more perfect organisation in the lith and 17 th centuries, to Fenry IV. and Lonis XIV. Under Sapoleon 1. there were 125 highounls, extending in all over 30,000 kilonsetres; anll at the present time there are mpwards of 600 mational roads ( $35,000 \mathrm{kilom}$.), 265,000 departmental roals ( 45,000 kilom.).

Postal Service-The postal service in F. goes hack to the sear $1 / 64$, when Louis Xl. placer it under the diruction of the state. Since 184S, a system of low premayment for letters has been established. At the present time, letters weighing from nnder 10 to under 100 srammes resuire stamps from 15 eentimes to 1 frane 20 centimes, accorling to weight. The whole receipt of the postal service was for the year $1571,01,242,000$ francs; while for 1869 , before the war, it was $04,199,359$ franes ; the expenses in the meanwhile have risen from 63 million franes in 1869 , to nearly 67 millions of francs in 1871.

Electic Telograph.-The first electric telegrnph was eonstrueted in F . in $1 \mathrm{St4}$, and F . is now intersected by a close network of wires, which flash commminations between Paris, as the euntral forns, and every part of the empire. It the elose of 1ST1, there were 43,511 kilonetres of lines, eomprising 129,633 kilondetres of wire. The number of teleshophic messares sent in 1871 was $7,417,400$, of which about $\frac{1}{4}$ th were international.

Constitution, Goxermant.-On Suptember 4, 1570, the emperor, Napoleon Ill., was deelared to be 110 longer the head of the state, and Franee was proclamed a repulalie. At the close of 18:2, the supueme puwer was rested in a National Assembly, with whom rests the nomination of the chief offeer of the state, bearing the title of "Presilent of the Frenel liepmblie;' and nominated for an moletormined puriod. This ufticer, as chiuf of the executive fower, lut under responsibility to the National Assembly, is authorised to promulgate amb insure the proper exection of all laws and ordinances tramsmitted to him by the president of the Assembly. 'J'he National Assembly is composed of 750 deputies, or members, elected by miversal suffrage, aul eligible without further eomelitions than those of eitizenship as Frewchmen, and gualitications of character and age, besiles that of not being either froter or suls-prefet of the department for which the canlinlate wishes to be elected. The hudget (for $1 S^{2}$ ) is eharged $8,624,000$ franes for the allministrative expeuses of the National Assembly aud the authorised indemnities of the deputies. To the Presideut of the lacpublie belouss, in aecordance with the principles that have regulated the respective domans of legislative and executive power in F . under all forms of govermment, the right of appointing the julves, commanding the forces, and maintaining relations and settling treaties with forem states, in respect to which acts be is responsible te the assembly. Ife ajprints and dismisses the ministors of state, whe are also responsible to the assembly, aml he may reside at the seat of the Fiational 1 Escmhly, and, proridel le gives notice of his intentims, may take part in its deliberations. llis salary is $1 i x m$, at the present a late ( $187 \%$ ), at
 frame for hourabule cxpenses. The utioce of
presulent is held by General Macalabon, who suceceded the tirst presilent of the republie, M. Louis Alulphe 'lhiers, in the present year, 1573.

The ministry is presided over liy aine ministers of state, each of whom has a detinitely limited sphre of administrative duty and authority ; and in adulition, the president is assistud in the sovernment hy a Couneil of state, 'Conseil d'Etat,' whiel, aceording to a deeree of the National Assembly, is to cousist in all of 43 members, 15 of whom may be nominated liy the president, while the romaining is are seleeted by the Assembly. The functions of this boly are restrieted to giving alvice on bills presented to tine National Assenlly by the president or the ministers.

Drparments, de.-F. is at present divided into S6 tepertments, comprising 30 ; aroondissements, 2S65 contons, and 35,985 communes. Each department is presided over by a prefect, nominated by the president of the republic on the presentation of the minister of the interior ; each arrondissement by a sub-prefet; each canton by a member at the general eouncil of the dipartement, whieh meets annually for whatever periok may be deereed hy the head of the state; and every commune has its maire and mumieipal council. Every ehief town of a canton has its commissary of police; in the larger towns, there must be one of these officers to every 10,000 inlabitants. The administration of justice is presidal over lyy a special minister of state, who is kecper of the seals. A supreme tribnnal serves as a court of appeal from the lower courts. The tribunals of commerce and poliee, together with those of the several departments, take cognizanee of the varions eivil and eliminal cases specially falling within their several spheres. There are 357 tribumals of the aromelissements, or tribumata de memier insionce, which are divided into six classes; -681 Iohee courts; 216 tribunals of commeree; 26 eourts of appeal, divided into four elasses; a Cour de Cassation, divited into three ehambers, which confirms or anmuls the sentences of the police and assize courts; and a Houte Cour de Justice, which gives final judrment in all eases of offence against the state. Assizes are hell every three months in 50 towns; and, indepentently of the ordinary judicial margistrates, the courts of assize are composed of juries of twelve men, chosem in accordance with certain prescribed regulations. In the maritime and eommercial towns there were, nuder the empire, Sj coumeils of piowhommes (experieneed men), with summary juristietion in matters to the amount of 200 francs. These conncils, which are composed of master-workmen elected annually, decide on enuses of dispute, chiefly in regard to questions of wain:s, and differences between masters and men. The state is eharged $33 \frac{1}{2}$ millions of franes annually for the expenses incident to the ministry of justice, according to the bulget for 1S73. There are Sor departmental prisons. 2l central houses of detention. 2 political prisons at Doullens and Belleisle, and numerons penitentiaries and reformatories for the young. All these prisons, exeepting the two for politieal oflenclers, are in part self-supporting. The only hulks, bumes, still remainiog are at Thiton, where convicts of a certain elass undergo their sentences, lut the principal lenal settlement is in French Gruiana (g. r.).

Irriejon, ('hmehes.-No person can be molested in F . on account of his religions opinions, 1 rovided the manifestation of them does not disturb the fublic reace as estahlished liy law. The puhlic exercise of any special farm of relurion must, however, be precculel liy the otheial authorisation of the presfot, ur in special cases, by ligher authority. The

## FRANCE.

the Protestant fincluding the Roformed and Lutheran, the Jewish, ancl, for Alseria, the Mohammedan. The clerigy attached to these religions receive their pry from the state, and are exempt from military service. The Roman Catholic Church embraces the sreat majority of the people. Of the $36,000,900$ which constitute the present pormation of F., 1,000,000 apprertain to the two l'rotestant chmrehes, Loboro to the Tewish persmasion; and 25,000 to non-recognised but tolerated emominations, the Anabaptists comprising nearly one-thirl of this number.

At the breaking out of the Revolution, the annual revenues of the church amounted to $150,0100,000$ of livres, and its lebts to $133,000,000$. The state appropriated to itself the funds of the chureh in 1789, and assumed the responsibility of maintaining public worship. The folluwing talle gives a summary of the expenses incurred loy the state for the maintenance of religion since the Consulate.

The archbishops and bishops of the church of $F$. are to be nominated by the President of the Repulblie, and canonically inducted by the pope. There are according to the budget of 1873, is arehbishons and 69 bishops. The archbishop of Paris reccives 50,400 francs per annum; the other archbishops. 20,000 franes; the bishops, 15,000 franes. Six Freach prelates hold the rank of cardinals, to which dignity they are nominated by the p"ple on the presentation of the president. Every archbishopric has 3, and every bishonric ? vicarsomenat, the whole number being 190. Their salaries vary from 3500 to 4500 francs. There are 709 canons belonging to the varions cathedral chapters, receiving from 1600 to 2400 francs per annum; 3437 cures or parochial bencficed clergy, who are canonically imbancted by the bishops, unter the apporal of the state ; and 31,356 curates or desserctuts. The cures receive from 1200 to 1.200 franes; the curates, 200 franes. The cures may be assisted by a certain number of vicariats, who receive from :50 to 500 francs; there are at present 9000 authorised by the state. There are in F. lut Feformed eonsistories, and 44 belonsing to the Latheran Chareh. The central commil of the liefomed charehes holls its sittings at l'aris. Synuds composel of the delegates of fire churches may assemble with the anthority of the state to regnlate the celebration of the services of their charch; hat their meetings cannot last longer than six days, and their decisions must be sulmittel fon the aprobation of the wovernment. There is a l'notestant seminary for the Reformed at Dhontanlan. Lesides the sums inseribed in the burget for the mantenance of relighom, the departments are charged with special ammal smbsidies, which have risen of late years in a mamil ratio, ami amounted in 1868 to apwards of 717,000 fraues.

Puhbir Insfontion.- l'ullie instruction is presided over in F. by a special ministry. Nearly half the experses commeted with it are deprayed ly the state, and the remander loy the departments. There are 1.5 academies lueated in the following townsAix, Deangem, Limpleanx, C'aen, Clermont, Dijun, Dunai, (remoble, Lyon, Montpellier, Nancy, laris, Puitiers, lemmes, 'fodon. These acalmies are
diviled into the five faculties of theology, law, medicine, sciences, and literature, and sumplemented by various superior ant preparatory shools. The professors are paill partly ly the state, and partly by fees. There are 81 normal shonls intended to train teachers for the higher injartments of instruction. Seconlary instruction has received an immense impetus during the present century. In 1s66, there were 41,500 free and publio schonds for boys, and 14,000 communal schools for the use of girls, and the entire number of scholars exceeded fons millions. In 156:3, the number of chiliren over cight and under cleven, who had never lieen to school, amounted to about 200,000 . In 1866 , about 30 per cent. of the military conseripts were unalile to read. The different clepartments share very mequally in the diflusion of elucation, and it may be generally olserved that the proportion of the elucated is highest in the northern and eastern distriets of $\mathbf{F}$. F. supports numerous colleges and schools for instruction in special branches of kuowledge: as LEeole des Chartes; des Langues Orientales; des Beaux-Arts, founded in 1671 by Louis AlV, Dessin, foundel in 1706 by Louis XV .; the Conservatoire de Musinue, founded in 17St; Lecole ale lome, founded by Louis SIV., and LEcole W'Athenes, founded in 1840 ; L'Ecole des louts et Chanssecs, for the instruction of engineers of public works; L'Ecole des Mines (1753); the Conservatoire National des Arts et Metiers, for the application of science to the arts and trades; the Central School des Arts et Netiers; and the national schools for arts anl trades. There are numerous acricultural, forest, farming, and veterinary schools, besiles the Ecole lolytechnique, specially desiguel to prepare youths for the public services; and military and naval colleges at St Cyr, Saumur, Paris, Vincennes, Brest, Toulon, ant St Denis.

Literary and Scimtific Institutions.- Among the literary and scientific institutions of $\mathbf{F}$. the first is L'Institut de France (r. v.). The Musemm of Natmral History, known formerly as the Jardin du Toi, is one of the hinest in the work. The Bureau des Longitules and the Observatoire, at laris and Marselle, have ocenpied the tirst rank among scientific institutions since their fomulation. These establishments are all maintained at the cost of the state. Paris possesses several libraries belonging to anl supported lyy the state, but freely opened to the pablic. The most important of all is that now knowa as la Bibhotherque Natiouale. See Limenfies. There are 33 S public libraries in the provinces, to all of which access is afforted in the most liberal spirit. $F$. is rich in public galleries of painting, statuary, and artieles of erfu. The expenses of secondary and primary elucation, literary and seientilic institutions, national archives, \&e., are charged in the budget for 1873 at $40,700,000$ franes.

Thoutres.-The theatre, like all other public institations, is unter the surveillance of the state, which charges the anmal bulget for the maintenance of theatrical companies; about b' millions of franes being inseribed on the burget of 1573 for the surport of theatres, the fine arts. \&c.

Chariluhle Institutions.-F. is rich in institutions of charity, many of which are remnants of the old system of church relief; hut the creches, of which there are seweral humbrels, and which are, in fact, free nurseries, are a modern form of charity, which orinimated (in 1841) with DI. Nlarhean at Paris. The pultic hospitals anel infirmaries are maintained ly special endowments, a percentage on the receipts at theatres anl other places of amusement, and by sulbilies from the goverument and local communes. lublic charities for the relief of mupers lerive theia resulnces either from departmental or muni-

Pulule Delit.-In1S14, the date of the liestoration, the interest of the delt was 63 million fruncs: umber the lamphons it rose to 200 millions: and from lasin to 184, Lomis Philippe increased it to a 44 millions. Buring the three years of the second rejuldie, a millims were paid of ; lont the second empire (1sio-1sti9) aded nearly 120 millions to the anmal humen. The increase of the debt during the empure arose from a suceession of loms raised hy berrewing directly from the mass of small capitalists, withnot the iatervention of large lanking hases. The amont of the national delat of France is very mandosly given accorling to what is iucluded under that heal; lont if we take the funded debt bearing rutesor interest, the amount of such rentes in January 1501 , before the war, is stated at 35 willim francs $=$ about ${ }^{2} 14,000,060$, representing a eapital of 11.000 million francs, or atti0,000,000 The loans and other obligations incurred to met the expenses of the war of $1500-1571$, including the indemmity of 5 milliands of franes to Cermany have at least doubled this sum, so that the national delat of France may be stated in romed mumbers at 23,000 millions ( 23 milliards) of franes. It has been calculated that when all the expenditure arising out of the war shall hase been fully povided for, the ammal interest of the delt will amment to one milliard of francs. or $\mathbf{t} 4(0,000,010$.
The contimal deticits from the elose of the first cmpire in 181.5 to the cluse of the second empire in 150, have heen covered hy leans, inseribed in what is known as le grumd liere de lie dolte Imblizue, and bearis interest or rates at the rate of 3,4 , 4?, and an in cent. The butsets votol ammally by the representatives of the nation have almost invarahty shewn a small assumed smplus: while the
 jublashed some years afterwards, has withont excegtion exhinitel a lare deticit. The following table shews the rate at which these deficits have increas.l since isly. Liut as the leficits for 1860 aml 1stad hase not yet leen aseertanem, their amont ean only le given conjecturally as estimated fron ulicial sampes.

The thal ratue of the Frem monev in eirentation
 mondare minn ethectal betwen France, holgimm, surtartank, and Italy, the emissinn of winel pieces is to be at the rate of 6 franes for every imbabitant. whinh, taking into acomat the presmand inerase of frimation to the year ISSO, when the term of the treaty expires, gives for France the sum of 2331 millinas; for likum 32 , for ltaly 141 , and for switzerlam 17 millions of franes. The amount of specte in raserve in the bank in January 1573 , was 7! 0,000, (1) franes : the ammont of motes in circulatom loy the lank and its banches was $2,58,619,270$ frabes. The maximm anomit of notes in eirculation has been fixel at $3,000,000,000$ franes, by the decree of the National Assembly of July $15: 2$

Arm\%-Standing armics elate in F. frem the time of Chartes \'ll. The law of 1532 regulated the system of recruiting ly eonseription, on the footing which, with few molitications, it has sulsequently oecupial. By the law of 1522 , substitntion and enlistment for money are prehibited, and the principle of universal liability to arms is lail down, in accordance with which every Frencham mast be for five years in the 'active army,' for four years in the reserve of the same, for tive years in the territorial amy, aml for six vars in the reserve of the territorial army. Besides the ordinary flysical canses of exemption, there are varions others admitted, arising from family, social, or individual conditions; while, morewer, yonny men who pass the necessary examination, may oldain exemption by enlisting as volunteers for one year only, anl lefraying the cost of their maintenance and clothing. The returns for 18,1 ave the strencth of the French army as follows: Feace-footing- 104,192 men, 86,368 horses; war-footing- $-5.207 \mathrm{men}, 143,23 \mathrm{~S}$ horses; while the estimatel cost was somewhat more than 430 millions of franes. Acenrding to the estimates for 183 , the French army is calenlaten at 54,5 wh men, including 425,000 infantry, 84,040 cavalry, and $: 36,000$ wher trops: and the presumad expenses at $4: 1,03,300$ franes. $F$. is divided into six military commands, or corps fromép, each muler a fieli-marshal, which are subliviled into districts commanded by generals of disision, and into lesser circles, eorresponding with the elenartments, and under generals of lrigakes. The fortitied chits-lienx are at Arras, Fayonne, liesançon, Bourges, Prest, Cherbourg, Grenohle, Langres. La Rwehelle, Le Havre, Lille, Lyon, Marscille, Montpellier, Nantes, Perpignan, St Oner, Toulon, and 'Toulouse. Metz and Strashar: were formerly included in this number, but since their annexation by Germany, Ariguon, Per. pignan, Quberon, and Toneu have been eonverted mto military chefs-lienx in their phace. Besides reqular troops, $F$. has its Cotede Nationale, which wis created in 1759, and legally organised in 1791. Since 1-52, the sphere of its obligations has been limited t, the maintenance of order in ease of threatencel insurrection.

Niery.-In December 18.1, the French navy numberel $\because$ admirals, 18 vice-admirals, 32 rearadmirals, 1832 captains of first-class men-of-war, 290 captains of frigates, 829 lieutenants, anl 160 ensigns The saiturs athoit and on shore mumbered 39,500, which, together with enumeers, \&c., hrought the araml total of thase employed no the fleet to 74,000 . The incripton for the navy owes its systematie orcanisation to the great minister Colbert (26S1). It present, all presons engaged in any maritime wneatonn loutwen the arges of 15 and 50 are hadle to inscription, bat the service is only cum-
pulsory for＂three years．Theme are lon，ont name＇s on the rulls．Of these， 130, mo may le eallet out in time of war．The dect connists of 401 vessels atloat，earryiny ：30l，suns：of these，3S are stemmers，which，including 62 irnuclals，screw and padille－boats，and foating－latteries．have a total harse－power of 92，627．＇There are 2．0． 6 ，marines in beace， 25,000 in war，ame 25,50 enstoms and coast－ chand men．F．has 6 dépots for mame artillery， fonndries，and $\frac{3}{2}$ manfactories for projectiles． There are special hospitals，schoole，amil libraries for the use of the nary；and 5 maritime listriets， subdivided into $1=$ arrombissements，at which are administrative comets for the settlement of all naval questions．

 disturbed ly constant wars with Eflward IIl. of Eugland, whin laid clain to the throne in right of his muther, a daughter ni Philippe le Bet. The war heynn in 13:39; in 1346, the hattle of Creey was foulht: at the battle of Poitiers ( t 3 56 ), Jean was made captive ; and hefore its fimal close after the Weath of Edward (1357), the state was retuced to haukruptey, the uobility exeited to rebellion, and the mass if the people sunk in barharism. Falsificatiou of the coinage, onerons taxation, and arritrary conscriptimas brought the country to the verge of irretrievathe ruin, while the rictories of Fuglant humbtel the sovereign, auviliatell the French armies, and cut down the flower of the nation. The huy and weak minority of lichard if. diverted the English from the prosecntion of their croundless chaims to the kingdon of $F$., which rurived somewhat from the effect of its long and disastruns warfare : but during the regency for the minor, tharles M. (Le Bien Aimen) (1:50-142: the war was renewell with increaseld vighur on the part of the English nation, who were stimulater lyy the tharing valuur of Henry S. The signal vietery won hy the Enclish at Azincourt in 1415; the treason am rebellim of the French princes of the hamal, wha governat the larger provinces; the ambition of the several regents, the ultimate imbeeility uf the king, the profligacy of his queen, anil the lewe of phasare early evincel ly the damphin; all complinel to aid llenry in his attempts upon the thome. But the premature death of Henry, the perSeveringspirit of the peophe and the extraurituary influence expreised over her countrymen hy the Main of Greans, concurred in hinging ahout a thuroush reaction, aul, after a perioh of murler, rapine, and anarely. (lantles VII. (Le Jictoricux). (1402-1461) was ctowned at liheims. He ohtaineat frum the Listates treneral a regular tax (faille) for the" maintenance of paill soldiers, to keep in check the merecaaries and maranders who pillagen the comntry. The prolicy of his suceessor, Lunis XI. (1-161 1493), the first kinc entitler 'His monst 'hristian Majesty, ' favenved the burgher and trading chassem at thu expense of the uhtes, white he humblew the prowe of the crosn-princes. He was a craity raler, who manared the finances well, and sureerden, $1, y$ phiny and mondthek, in recovering for the erown the territorics of Maine, Anjou, ani l'rovence: whll he male himself master of some purtions of the territorins of Charles the Bolla, Duke of Burcumly Clarles V'lle. (1483-1.198), ly his marriacs with Ame of Brittany, scenred that puwerful stath. and cronsolidity in the increasius power of the "rawn. With him endel the direet male steres.

(Le l'iredu Peruhe) was tha ouly remenentative of the
 Was to ronfirn the regal suprenaity, white the gencral emmition of the perphe was amelionated. 11s and his sucesssur, Francis 1. (150-154), of the Toluis-a n foulime tranch, wasted the ir resmures in futile attempts to estaldish their herelitary clains to Lomardy, and were thus perpetailly cintiroiled with the Mouse of Anstria. A concortat with tho 1mpe, signed in lald, secured the nomination of the Gallican lishops to the kiny oln this reiga, the Assemldy of Xutalhes and Deputies supersefled the Gencral Estates. The deficat of Francis at the battle if lavia, in 1595, and his sulserpuent imprisonment at Malrid, threw the allairs of the nation into the greatest disonter, and embarrassed the public finances to a must ruinmas extent. Arts and literature were encouraged in this reign, and in that of the succeeding monarch, If enri l1. (1.25-1559), who contimued the disastrons ltalian war. In the latter reign lugan the perscutions of the lrotestants, which were carried on with still greater eruelty under Itemi's three sons, Prancis II. (1599-1560), Charles IN. ( $1560-1574$ ), and Henri 1II. ( $1544^{-}$ 155\%), the last of this brinch of the ralois, The massacre of st lartholomew (15:2) was perpetrated under the direction of the quecu-mother, Catharine de' Medici, and the confuleration of the League, at the head of which were the Guises. The wars of the League, which were carried on by the latter against the Bomrlon brauches of the princes of the bivod-royal, involvel the whole nation in their vortex. The succession of Hemri IV. of Navarre (1559-1610), a Eourbon prince, descended from a younger son of St Louis, allayed the fury of these religious wars, but his recantation of Protestantism in favour of Catheniecism, dis.appointed his own party. The early part of his reign was perpethally disturbed by the mutinies of the troops and the relehtions of the nobles. Sy degrees, however, Henri, through the astute counsels of his minister sully, and by his own personal popularity, raised the power of the crown higher than ever, while he beyan a system of thorough administrative reform, which was only arrested hy his assassination by the famatic Ravaillac. During the minerity of his som, Jonis XIIT. (1610 - 1643), Carinual Richelieu, unter the nominal regency of Marie de" Mediei, the queen-mother, ruled $\vec{F}$. with a firm hand, although his oplression of the I'rotestants at home, and his co-operation with them abroad, in endeavouring to humble the IIonse of Austria, entailed tony and costly wars with little fame un France. Cardinal Mazarine, under the regency of the queen-mother Anne of Anstria, exertel nearly equal 1 wwor for some time during the minurity of Lonis N1Y. (1643-1715). The wars of the Fronde the miseonduct of the parliament, ant the humbling of the nobility, gave rise to another civil war, but with the assumption of power ly young Louis, a new era commenced, and till near the eluse of his long reim, the military successes of the French were most brilliant, and the boundaries of $F$. were enlargel very nearly to what they were before the war of 1500-1571. The military glory of the kinurlom was maintained ly a host of gallint commanders, amougst whom strod conspicuous the names of Turenne, Vaulan, Luxembourg, Catinat, Frumbe, Boufilers, and Créqui. while, by the farsichted poticy of the minister Lourois, a well-organisel arny anil a newly-created navy made the power of F . formidialde to all neighlouring mations. The progress of the prople in the arts of peatee was not lusi makel. At the eluse of his rule, the oprressive war-tixes, the prowigality of the court, the juxurious lives of the clergy, and the absolutisin and bigotry of the agrad momareh, comblined to undermine the

## FRANCE

foumlations of national prosperity and freedom, and at his death the state was left trammelle with it deht of shou millions of lives, and his youthful beir, Lrmis IV. (IT15-1755), succedet to a heritage whose glory wats tarnishell, and whose stability was shaken to its very fomdations. The long inglarious reign of Lonis " $X$ '. presents nothing worthy of notice exeept the gralual rise of those sentiments of infidelity and licence which prepared the overthrow (if all the ancient institntions of the country. The regeney of the protligate Orleans maved the way for the miseries whieh followet, while his corrupt financial arministration luronght the mation into the most overwhelming monetary embarassments. In this reign. Corsica was adiled to France. The thorongh disorganisation of the state, aml the neglect of the fleet and army, prevented all attempts at conquests either on sea or land. The colonius were left a prey to the attacks of other powers, while the capricious ehange of Iolicy which the king's mistress, Madame Pompadour, forced upon the government. brought contempt upon the country. The peace of Paris, 1763 , by which the greater portion of the colonial possessions of F . were givea up to Enclanal, terminated an inglorions war, in which the lrench had expended 1800 millions of francs. The elose of this unhappy reign was still further disturbenl by the eabals of the Jesuits, who were tinally banished in 1764. In 1774 , Louis XV1., a well-meaning, weak prince, suceceded to the throne. His first ministers, Manrepas, Turgot, and Malesherbes, had not the vigour to carry out the reforms which their sense and patriotism suggested to them, and they were soon compelles to yiclal to the intrimues of the mobility, aud resign their 1 lates. They were succeeded by the financier Necker, who endeavoured, hy economy and method, to arrest the impending bankruptey of the state, and succecding ministers made futile attempts to diminish these financial disorders by new forms of taxation, which were generally opposed either by the assembly or the colirt. The American war of freedom had lisseminated rejnblican ideas among the lower orlurs, while the issembly of the Notables had discussed anel made known to all classes the ineapacity of the government, and the wantom pronigality of the court. The nohles and the tiers cat were alike clammous for a mecting of the States; the former wishing to impose new taxes on the qation, and the latter determined to inamgurate a thorongh aml systematic reform. Aiter manh oprosition on the part of the kin? and connt, the Etuls fïmriatho, which had nut met since 1614 , assembleal at Versailles on the 2ith of May 1789.
F. was at that monent ripe for a revilution. Although the nolility was excuedingly numerous (as not only dirl the children of a nohle belong to this class, lut its numbrs were constantly being increased by creation), there were great difierenees in the rank and dignity attachod to the order; thus, in 1759, there wore only $4 t$ sechlar pers, independently of the princes of the hlond, imd the six oricinally created ecelesiastic meers: but the lower mades of mobility weve so munerous that their numbers stood in the ration of 1 tor :3n) of the entire population. Jevertheless, every grade of mubility exemipted its holder from the pament of the ordinary lamal tax, or taille. from the ehare of mantaining the public roals (corve), from milatary conserintion, from receiviug hillets of soldiers, \&e. 'The nobles paid the capiration tax, but in a very unequal proportion, althonifl the landed property was vested almost entirely in their hands. They, in fact (together with the clergy), monopolisel the principal share of the national revenues, and left to the lower classes the burelen of lahour and of paying the taxes. At the outbreak of the Revolution, the lirench nobility
wore sunk in protliorey, amel falion to the loweat stane uf themuralisition. The elergy kept pare witl the nohles in Equeral theravity, ano while threit arrmuerate revenues amomatell, ascording to
 Properaty stanl in the relation of 1 to $\mathrm{B}_{\mathrm{a}}^{3}$ of that of all wther Inoprietors, their eontributions towards the mantenance of the state wo mondognate and irrernlar. The npen profliracy and exesesses of many of the lighor members of the hierarely, moreover,
 1. hate wrune from the church it tithe known as the revime puschalime, and every five yeats the cleray wore expected to present their su-ealled dons gracuits ordinuires, of from 1.5 to 15 million of livres; while on aceasions of nueal thay from time to time made extrammary dons gootuits, which, luwever, were usually repainl at luns intervils. The firse itat were crushed lyy the weight of an wajust taxation, whicl was rembered more nhmoxions by the system of farming ont some of the taxe's. The nust tyranical of the we was the tax on silt. The mancipal institutimes which hand been promitted to Hthrich umber some of the Valuis princes in the numble age's, were almonst entirely atolishecl, and the others of towns, hke those of the state aml the courts of justiec, were either hereditary or olen to purchase. The thers étut, Which included professional men, and all who were not either members of the moble or the clerieal orders, sitw themselves utterly exeluled from all barticipation in the privileges and thaties of free citizens, at the very time when the extensive cirenlation of the writinge of the philosonhers of the lythe., as Yoltaire, Malesherlies, limusseau, and Montespuicu, lial habituated men's minds to the discussion of questions of $I^{m b i t i c a l}$ indermmence, equal rirhts, aml miversal frevlom.

The resistance made by Lonis and his advisers to the reasmanlle demands of the 1 bemotion un the 17 th Jume 17 si, led to the constitution of the: Sational Assembly-a measure which was fullowal, on the 23] of Jine, hy a declaration of the inviolability of the members. The kinor retaliated by onderines a lares louly of tronps under amm, dissolven liss ministry, and hasishet Necker, whom he had shortly befure verallad mantr the pressure of public "piniona. The comserumen was the omtbreak uf insurnectionary movements at l'aris, where blend was shat on the lath July. On the followine alay. the uatanal gataral wats convoliad ; and on the $14 t l_{1}$, the $\mathrm{l}^{n+0}$ ple trab prasussion of the Bastille. The provinces repeated the acts of l'aris. amb everyohere national grames and revolutionary municipai comacils were
 manorial riehts were abrorater hy the Sational Assumbly, which gave expression to a solemon declaration of the equality of human riglits. The ruyal princes and all the nobles who eond escape suibht safety in thight. The rugal fimily having attempted in rain to follow their example, tried to conciliate the pernfe by the feismed assumption of repuldican sentmernts; funt on the zth thetuber, the rabole, fullowed by mumbers of tle national guard. attacked Versailles, ant compellad the king and lis family to remone to Paris, whither the Assembly also morber. The mext two years witnessenl the sulumn inamoration and the subsequent retraction of viarious constitutional schemes; the jrinees of the home and the ancient noblesse raised corps of enionés in different parts uf the eomntry, but their oflorts could nut arrest the spread of republicanism. The king alternately made concussions to the 1epullicans, and cherisheil schemes for eseaping from their survillance, but each montla added to his hamiliations and to the audacity of those

W"I. came t." laris to crown him and his wife buchuine ; a new moblity was rapmly erated, anel the relatives and favomites of the enideren rectivel wapluishool kingloms and prime inalities at his hands. For at time, Xalulenn's intluence with the weakencti

 ante cxapt in the Peminsula, his ams were ereryWhore rictorions. By his marrian with the Areh. luthess Marial Lonisa, tlaghter of the Emperor of tiomany. Namem secmed to have given to his thame the frestige of hirth, which alome it had backel. Ile now avaided himself of the freedom afforded ly the peace with Austria to expand the material irosprity of the comintry, ly eneoraging trade, constructing mals, lrilues, and emals in esery bart of the empres and he ronsolidating his government, and organising acomple cole of laws ami a systematie mote of alministering them. but this periol was the poorest in respect to the literary and scientitic derelopment of the natinn, whe were too much trammelled by police supervision and military discipline to exercise freedom of thought and intellect, and this interval of comparative repose was sion interrupted ly the anbitious designs of Napoleon on Germatas, which led to a declaration of war ayamst linssia in 1812. From this time to his final idefeat in 1515 , the emperor rapilly reecleal from the lofty station he had won for himself. The tisastrons linssian campaign, in which his noble army was lost amil! the rigurs of a northern winter, was som followed by the falling away of his allies and feudatories. Majoleon himself was still vietoribus wherever he appared in person. but his generals were beaten in mumoros engasments: and thos great defeat of Lejpsic compulled the French to retreat begond the lithine. The Swodes brought reinfurcements to swell the ranks of his comemes on the east frontier, while the English pressed on from the west ; the scuate ank his ministry betrayed his canse, and the allies thew themstives on Paris, which, in the absence of the cmperno capitulated after a short resistance, Narch 301.1814 . Napoeon now alnlicated in farour of his young son, amb retired to the island of Flha, the sovereignty of Which had been manted to hinn. His wife and son remered to Vienna; his family were declared to have forfeited the throne; F. was reducel to her former limits, and the provinets she had acquired were restored to their mational rulers. On the $3 d$ May, Louis XVIII. (the brother of Lonis XV1.) made his entry into Paris. The couluet of the burbons dil not coneiliate the nation: they returnal baded with delits, and surronneled by the wh mobility and elergs, who had not renomeed their former privileges, amd who lowed upon the ueneration of Fremchoen who had arisen tharing their absence as their matural enemies. A narrow spinit influenced the weak pelicy of the king. which led to the establishment of a striet cemsorship, the cxtension of the powers of the police, and the perscention of all the adherents of the Empire; while the lower classes and the amy, who were alike serusible of the humiliating reation whith had followed the former exeitement of war and conquest, were treatel with an indilferenee, and aren contempt, by the returned emigres, to whieln they were whelly unaceustomed. On the lst llarel 1815, Kapmieon left Elha, ant landed in France. Crowds followed him: the solfiers flocked armmel his stantand ; the benurnous then, ant he tonk possession of their lately leserted praces. The news of his lanting spreal terror through Lurope, and on the Esh Marelh, a treaty of alliance was sigued at Vorma letween dustria, linssia, Prussia, and Englam, aud beparations at once made to put
down the movement in his finour, and restore the Boumon dynasty: At first, the old prostige of suceess seemed to attomi Napmenn; hat on the 18 th Jnue, be was thoroughly defeated at Waterlon; and having placed bimself under the safemard of the English, he was sent to the island of it Helena, in confurmity with the gencrally rekmwledged sentiment, that it was necessary to the peace of Emope to remove him finally and definitely from the seede of his former power. The second restomation gave measion to many pledges of a more liberal policy on the part of Louis, but few of them were fultillech, and a geveral amb sulhen discontent remen among the periple, who were again deprived of all roice in the edministration, or in the dection to offices, and were harassed by the petty tymany of the priests, who we the favourite advisers of the crown. In 1521. Naphleon hreathed his last at Nit Helena: and in 182t, Lonis X'VIIT. dies withonat direct hors, and his brother, the Due didrtois, succended ats Charles X . The same ministrial inerpacity, wat of good faith, general disountent, and excessive priestly intluence characteris.al this reinn, whin was abruptly lirmatht to in alose by the revilution of 1830, and the elemtion to the thrme of Lomes Philipe, Duke of Orleams, ats kins, hy the will of thoprople. Legitimist insirrections disturbed the nation: one Emme sucrectcll another : attompts mon the kinges life were frepunt; but the progess in material prosucrity made the government popmar uith the bourgeovie, ur midulle classes, and for a sime it held its ground. The warlike propensities of the nation foum an ontlet in the war in Alyeria (4. 5.) with Abs-el-Kader. Bat the determinel resistance of the king tur the growing desire for electural reform lai at list to aren insureetion in Paris; and Louis Philipre luving abdicated (Fehmary 2t, 1848), a hejnuble was prochaned, under a provisional government. An iusurrection of the hed hepublicans in Paris ( $\boldsymbol{J}$ une 1StS), was only put down after great slaughter. Louis Napolecin (4.v.) was elected President of the Republic in December 1 s 18 ; luat by the famons coup d'etat of 1 hecember 2.1851 , he violently set aside the constitution, and assumed dictatorial powers; and a year after (ol December 1852), was raised, by the almost manimons voice of the nation, to the dignity of Emperor as Napoleon 111. Itis rule was me of complete absolutism, under which, however, France male great adrances in the develnment of her natural resonrees, anl in mannfactures. Assuming the character of an alluster of the wrongs of nations, Napoleon proclaimed himself a mediator in the 1):nish and Austro-1'russian wars, and the defender of the Italiuns against Anstria, of the l'ope against the people of Italy, and of the Mexieans against the govermment of the Enitel States of America. By his help the italians were velieved from the Austrian yoke, and the pope was left master of lione ; but in Mexico his intervention only led to greater bloodshal, and ended isominionely for the ofory of f , and fatally for the canseand life of his proting, the Austrim Prince Maximilian (1.v.). Attempts to gim a l'ussian alliance ended in humiliatimg repuldes. Aluhough the brilliant suecess of the Pitris Exhibition of 1507 seemed to afford evilence of the promand amd mational comsiteration in which the emperor was helh, his pohtical erelit had alrealy then lost its importance. At lome, the great financial embrassments of his government were arousins the disenntent of the people; and to avert the eqowing disalliction, Niqu. leon oflered (1SGO) to adipt a comstitational form of government, and to make some concessims in regurd to freednm of the press. It was soon found that the responsibility of the ministry was tictitions, and that the emperor availed himself of its protection oo cloals 187
lis own acts of persmal whemment. The result of the appeal made to the nation in 1570 , on the plea of scemimg their sanction for his priliey, wias not what he had auticipaterl ; and the 30,0100 dissentient votes given by the tronps in this plobiseite, revealed a hitherto mosusperted source of danger. Cominnat in the efficiency of the army, and andions to rekindle its ardur, he availed himself of a pretext to leelare war arginst Prussia. The course of counts in the short lut terrible Franco-German cuntliet of $1570-1571$ electrified Europe by its unexpected character, revaling at onee the solility of Prossian strencth, and the hollowness of imperial luwer in F . Within a fortnight of the emperor's appearace at the head of his troms at Metr, July 25,1500 , the strength of the Freneh army was amililated, Alsace and Lorraine were nconped ly Germans, and the Chanher of loputies in I'aris was clamonring for his abolication. On Suptember 2, Napoleon, with his army of 90,000 men, surremderel at sedan, and on the 4th, laris was in relucllion, the senate dissolved, the Empess liegent a fugitive on her way to England. and F . proclammd a Republic amid tumaltuons exeitement. Before the close of Soptember, Strasbure, one of the last hopes of F ., had capitulated, and laris was completely invested ly Gemman troops; and on 5th October. the l'russian king had taken up his hembuarters at Tersailles. The fall of Hetz, with soll,001 men, eompheted the disisters of the year. In Jannary 1sil, the mitent efforts of the different liranches of 'the Provisinal Govermment of Defence,'respectively installed at l'aris and Tomers, succeded in Uringing about an armistice, after the besieged l'arisiaus had for four months been hourly exposel to the fire of the enemy, eut off from all commmieation with the outer word except by balloons and earrier-pigeons, and finally threatened by fanine, With the concurrence of l'ussia, the French nation now proceeded, hy a feneral clection of repres utatives, to movide for the exisencies of the country. The First National Assembly of the Frend Fieprolic met at Bordeans in Femmary. After receiving from the Provisional Government of Wefence the resignation of the powers comidicl to them ins semitember 1s70, the Assembly umertook to organise the lipmblican Govemment, and nominated M. Thiers chief of the executive power of the state, with the title of Presiment of the French liopultic, hut with the condition of responsihility to the National Assembly. On the Ist of Mareh the preliminaries of peace were finally ratilied at Bomeanx, the chief conlitions being that tha province of Alsace (except liolfort) and part of Lorraine, Beluding Metz, shonlil he ceded to the treman empire, and that F. shomb pay a war indemaity of 5000 millions of france, and continue to be occumend by German tromes till the money was all paid. This emormons obligation is now (siptember 1s:3) dischargel, and luring the preent month F., after an occupation of three years, has leen fimally relieved from the mescuee of foreign troops. In the spring of $I \checkmark$ al, the prace of $F$. was serions! y theatened by a snceessful outbreak at l'aris on the part of the (ommunists (I. v.), who after creat blowshed and uricoms damare to public and private property. wrere quellel ly the regular army, which had sited with the $=$ ruverment, ani on of hay order was restered in l'aris since then, F. has heen sucessufnlly tryine to olliterate some of the numercus misfortun"s resulting from the war, and commerce and mational prosperity are hegriming to revive The doitly of the ex-Emperor Napoleon, in $1 s i 2$, at chiselhurst, where he had resind with his fimily sin e lis liberation in March 1571 ; the retiremont of $M$. FRANOIE COMTE，an old province in the east of France，in the basin of the lihone，compriced what now ferms the departments of Dinlos，Hate－ Sutuc，and Jura，and had for its calpital Brsançon．

FRA＇NCHIRE，in its pritieal acceptation，the frambisu may be said to be the right which centres in the imhnidual lomhing it to exercise a certam lamited purtion of the general sovereisnty of the state．A franchise in this sense is possible only in a free state，i．c．，in a state in which the governed， as a whole，are ildntionl with the governors．It dios not nocessarily involve the idea of representa－ tive cosermment ：fir where legislation is effected by the votes of the frople thanselses，as it was in the small states of antiquity，the franchise is exerciand by each individual directly，without the interventan of any representative machinery． Where repesentation has becn introducer，the framhise is the right which the eitizen has of viting for his representatise，not the right of botime in the legriative landy comferred on the rementative in cumserpence of luing sent thither， and is an expressim not of the stowrequty which centres in him．hat of that which belong to the constitnents whe rend him．There wonld be no themetical inwonsistency，lowerer，in arplying the Wran framenise to the right of voting in the tlouse of Lords，which Indomest to cach perr．bucamse he hore＂xarciers the sovendighty，ur uriginal frectum whim belones or is supuspel tolndong，to himself， and dow in represent that of whers．As the fram． whise is the 1 ＂htibal＂xpresion of the sowregnty wheh wenthes 10 rawh free＂itizan，the extent or vidue whir heoght to bolme to the framehese will be motanted ly the anment of the soweregnty whing

the ammant of paxser and intlacnee which is com－ conded to hom hy the soncety of which he is a part． I theoretiestly just framehise，then，would he whe which correspanded accurately to the social prosi－ tion of each individual，which translated the ver－ dict hy which sorciaty fixed his status into the lamage of pelitios．Fint scientitic accuracy in sueh matters，for whwo reasons，is unattainalile．An appoxumatien in the indivilual case is all that is prssible in dealing with the mass，and one of the questions which is at present mant keonly diseassel annomgst speculative politicians is，by what test shall this aproximate estimate of social value te lirogght must nearly to the trath．Mr J．S．Mill has propesed intelligence as imbeetcel loy instruction，as the sole ineasure of individual sovereignty，and， conserucntly，as the basis of the franchise（see his work on lepresentative（iovernment）．Others have proposed wealth；whilst hy a thind class of spec－ ulators it is contended that，in the case of each individual，there are varions chements of social importance which must be takn into account in detcrmining the $\mathrm{p}^{\text {nlitical }}$ value which is bis duc． by all the mare wecnt writers on the theory of nivermment，however，the intea of all citizens bein！s entitled to an eyual suffrage，however great might the the disparity of intuligence，wealth，manhood， and other elements which go to make up social importance，is repuctiated as a scientific absurdity， anil reprobated as the source of all the practical injustice wheh results from what are commonly known as democratic governments．See Mill＇s work， alluded to alme ；also Paflameatahy Eafetion．
FRANCHISE in England is a royal privitege，or hrach of the crown＇s premation，sumsisting in the hands of the subjecto being durived from the arown，franchises must arise from royal grant，or in some cases may be held ly prescription，which presupposes a grant（ntephen＇s（om．i．637）．The suljaets of franchise leing the preculiar property of the crown，correspond with what in Scothan are called Leminia（ $\mathrm{q} . \mathrm{v}$. ）：and a franchise is analogoms to a grant of regalic．Gifts of waifs，estrays， wrecks，treasure trose，royal tish，and forfeitures， all of which are the precogatice of the erown，are franchises．＇The rights of forest，chase，park，warren， and fishery are also franchises，no subject being entitled so to aprly his property for his own con－ venience．A county falatine（ste Palativa）is the highest species of franchise，as within it the earl， constahle，or other chicf oflicer，may exercise with－ ont control the highest functions of the sovereign． And as the crown may thus erect an entire county iuto an independent jurisdiction，so it may create a liberty or bailiwick indenement of the sherill of the county．This，then．is another species of franchise：．It is tikewise a franchise for a number of jursons to be ineorpurated，and subsist as a holly－ $p^{\text {wlitic，with a }}$ wher to maintain perpetual suces－ sion，and do other corporate acts ：and each indi－ vidual member of such corporation is also said to have a franchise or freedom．The right to hold a fair or market，or to establish a ferry，and to levy tolls therein．is also a framelise．Where the holler of a franchise is disturbed in his right，he may sue for damages ly an action on the case；or in the case of now－pryment of tolls，he has the remedy of Distress（ $q \cdot r^{\circ}$ ）．Franchises may he extinguisheil by reunion with the crown．or may be lost by mixuwer －that is，such a nae of them as is contrary to the oxpress or implied amblition on which the royal arant preveded－a by non－user．
 Dietator of Jomanay，was the sen of a semall limbed japmeter，uf French or fontughese origin，and was
born near the tuwn of Asuncion in $175 \%$ or 1.95 . He was intended for the church, studicl at the university of Curdusa de Tucuman, where he touk his degree as a doctor of divinity or of canon lave and was for some time a theolugical professor. Subsequently be alopted the provessins of law. to the practice of which he continned to derote himself for a feriod of thirty years, gaming mats reputation for learning, skill, "bunesty, ami independence of character. When be hal attained the age of finty-two of fifty-thres, the revelution which shattered the Syanish yoke in 'ronth America bruke ont in Buenos Ayres. l'aranuay at first olferel active ינposition to the rembutionists, but ultimately sought to obtain inderemelence for itself. F. took a leading fart in the movennent, and was male secretary of the imlepnolent juntia set mp, l, at be soon resigned his ${ }^{1 " s t}$. The conviction, howerer, heiug strome in the malio mind that 1 : alone could properly wiect the affairs of the nexb remblje, he was, in $15 l \%$, aprointerl joint-consul along with General Yugros. The latter, howwer. was a man aprarently without much intellect or energy, and F , was really suhe ruler from the first. la 1sit, he was alpentied dictator for the rears, at the expiry of which time thas dictatorship was: givers him fur life ; aml the alisolute control so conferred he exerciscl until his death in 1540. Unaler F., the comblion of D'aragnay rapidly improved, and the ystem of non-intercouse, polltical or commereial, with other nations, which he enforced, hrmever much it may seem to prove him devol of administratime sagacity, was matonderly attenled with groul results to his country. si strict were the rogulations against furcign intercourse, that ingress tu, or erpexs irma, Paraguay was mext to impossible: and Fis treatment if some foreigners who dind get in (amomer cthers the fanns saraut Fonpland), and of others who were porvented entering, sarouren of harsloneas, and cren barbarism. Iet his almimistration talent was of a high ordur. He inn wowel agriculture, makin! two crops of curn irow where mily one had gronti before. Je introflaced schombs, monnted einner tion, repressen sureratition, aurl enfincel striet justice leetween man anm man in his law-connts. His death was requetted by the inople as a public calamity-the lest prouf that he: was nu vulsa tyrant. Nee liengger and Longchampis Exai Historique, \&e. (Paris, 1427); Francitis Fitign of Temm (Lomion, 1839), by J. P. and W. P. Lidiertson, troo younir seothmen whom 1 . turnel mot of the comutry: aul T. Carlyle's cesity in the E, linturigh In rive (1)4.3
 orler, and a saint of the Foman C'atholic Church. was one of the ment extrandinary men of his ase, and merits a detailed motive, as ilhistrating in his careur all the mest remarkable characteristics of the religions life of the mithle ase. He was born in 115, of the family called hernardimi, at Assisi, where his father was cheagel in trade. His hapo tismal name was duhn; hat from his familiarity with the liomance, wrange of the trouladours. in his youth. he aequirei the name of 16 Francesco ('The little Frenchman'). lu his early years, he was remarkalde for his love of gajety and ostentations proligality; lint even then his bonnty to the poor Was one of the largest soureces of his wasteinhess. He engaged eagorly in exercisos of chivalry and of arms : and in one of the petty feuls of the time, he was taken prisoner, and detained for a year in captivity at Perngia. An illness which he there contracted turneil his thoughts from earth; and although he again engaged in military $l^{\text {pursuits, a }}$ a secomel illness at Spoleto decided his career for life. IIe now
resobron! to fulfil literally the eounsels of the sispel, and he esperially deveted himself to puscry, when, in the mystic langase thenceforth inmiliar to him, In desimated as "his bride. Loder an impulse which fir receivel whila listening to a sermon, he took a yuw never to refuse alms to a Legqar. He made is gilerimace to the tomb of st l'ot or at liome, amil there didiral to (ionl all that he possessed on earth. (in his return to Assisi, he exchamged his chothos with a pun mendicant ; and disergarding all rumbstrace and ridicult, he erer afterwards continame to wear the meanest attire. He grate to a
 "this horse. which he solld for the purpest, and even soneht to apmonriate to the same use the moneys of his father, which, however, the prowt reiusal to acelpt. Tor avoill his father's anger, he tow wefuge in it cave, in which he spernt at month in solitary mas.r. and from which he retumel more than ever conhimmen in lifs enthusiasm. Whis fither having in vain contincal him in a dark room of his own house, cited him hefore the magistrates, and, wn E.s dectining all ciril jurisiliction in such is case, luefore the hishop, in order to compe him to remonnce his inheritance. F, abominatel all, even to the very chathes he wore, and then declaral that 'thll nuw he had heen the sua of Jernarimi, hat that heneeforth he: hat lout me Father, Him that is in heaven.' Thenceforth, no homiliation was too bow fur F: h. beggen at the gates of monatsteries; he rischarged the mint menial othices; he servel the lepers in the hosental at dablho in their most acralting necessities. and with the most tobler assinhity. He Wonkeri with his own hanis at the lmilding of the char ha st Damian and at that of sita Maria devi Inceli, which he alterwarls called his 'Portinncula,' or 'little imheritauce; and as the last aet of sclfspoliation, ann the fimal aceptance of the gift of poverty, he threw aside his wallet, his stidf, and his shoes, and arrayed hino dif in at sughe brown thaic, of enarse woollen cloth, girt with it hempon conel. This was in his e6th gear, in 120s. Ilis athusiam lif degrees excitenl conulation. Two of his frllow-tonnsmen, Bernard guintavalle and Peter Gittanm, were his first assuciates. They were followial, althongh slowly, by others; anl it was not till 1 II 4 , that, his hrotherhood having now increased th eleven in muner, he trow mp fin them a rule, subecten in the true spirit of relisine conthasiasm, he thrien moning at rantom the gusels upon the ailtar, aml tukiou the passares thus indicatol as the hanis if the sumbs institute. (Mihuan's Latin Ehraituni?, iv: erfit The mew lrethen reparal to Fome, where their male was aphoned (though at first whly cive roer) lig J'tle hnoment III. in 1210. The two following years were spent ly the trotherhomb in preaching aml exherting the people themuth the rural districts of their native and the
 Assini in 1212, at which time he linally settlent the simple comstitation of his moler, the churel of Sta Maria deyli Angeli being assigand to them as their home. In common with the dher fomes of monastic life, tha Franciscan institute is founded on the three yows of chastity, poverty, aml obedience; lut of these the secund was, in the eyes "f F', the lirst in importance and in spiritual cficacr. In other ordue, the jractice of powery cmasist i in the mere negation of riclres. With Fo, it was an active aud positive pinciple. In uther mplese, althongh the indiriduals could not prases, it was lawful for the commanity to lodd, property in common. F. repmatiatel all ilea of property, alike for his order and for its members; he cren disclainal for them the property in thoso things which they retained for persumal use-the

In i-6t. F . was again sent ly the Assemtly as arent to Fondand. The paliey of taxing the conmies had alrewly hom avitaterl, and he was instructed hey the Assimbly to na, his eflorts against such a nicasure. But the ministry had formad their phans, and the Stamp Act was passal warly in 176. It cansal a great excitement, and met with the most hetermined opposition in America. At the legrinning of $176 G_{\text {, a }}$ new ministry having come into lwwer, the subjuct was again limught to the attentime of prolianent. $F$. was exmmed before the Hlunse of ('mmmons, on which occasion his talents, his variol information, amd his presence of mind, wore shown to great alrantage and the repeal of the ohmoxims itamy det was the result. lat other laws deemed equally objoctionalle remained in fored. In the dispute between the American colomies and the mother-comutry, F. had somight sincerely and earnestly to preyent a disuption; when. however, he lecame combiucel that a sepsiration was ineri. table, he returned home and tonk an active part in fromating the canse of inderendance. He arriven at Phibulphia on the sth of May 15in, after an ahance of rather more than ten wars. The day after his arrival, he was manimonsly dected by the Assembly of Pennsylania a relemate to the Necond Continental comgress then alont to assembles. IIe was one of the committee of five chosen ly congress to preare the ecturated' Declaration of Independence: which, havime lech manmandy agred to no the th of inuly 17-6, he atterwards sighed with the wher leading gatrints. Towards the close of the same year, he was sent as amhassador to the French chint. To him is tue the principal, if not the sule. credit of eflecting between France ami the Inited States the Treaty of Mliance, the stipulatims of which were so mmently firomalale to the lattor country. This treaty, sigued at Paris the bith of Fehmary 1-5s, may be said to have securel the imphemince of the American colonies. $F$. romained in Lurope some time after the establishrment of prace. In 1595, he returned to PhilaAelphia, where he died on the 1-th uf April 1790 , argel st years.

In prison, F. was of a molium stature, well formed, aml strongly louilt, with a light eomfluxion, aud gray cyes. His manmers were affable and engaging. He was remarkable for simplicity of character, and $p^{\text {ractieal }}$ common sense. Ile deemed mothing which concernel the interest or hapimess of manlind unworthy of his attention, and rarely if wer lustowed his attention on any sulbect without ohtainius permanently useful results.
LI. Jeft ambur his numerous works an extremely interesther ani instructive antuhnograply of the (arlier ${ }^{\text {nittion of }}$ his life, extending to his fiftyseeond year. A complete collection of his works,

## FRANKLIN-FRANK-PLEDGE

edited hy Jared Slarks, has leen published in ten volumes octavo.
Of F.'s living pinsterity, there is mone toangr his name. Amonis the kescemdiants of his danghter Samh, who was married to Itiehard Bache, seteral have risen to eminence in science or literature.

FRANKLIN, Remrammind Bhe Joms, an English maval officer of distinguishod rymutaion, was bom at sidshy, in Linculushire, Antilla. 1756. Ho was desended from a lomg line of frediohers. and was the yomgest son of a respectable yeman. F. received the rmimonts of his aluation at int Tves; afterwarls he spent two sears at the grammar schome of Louth. It is statell that he was intemend for the chmeh, lont as he disidayed a decidend predilection fore the sea, his father wisely abombned oprosition to his chome of a pofession, and procmert him, in lsoo, a mirlhipman's $p^{n i s t}$ an bowed the Polyhemes lime-uf-rattle shif. In the following year. F.'s ship, len the wam in the ilesperate battle of ('opeonasen. Two months after, lis was remover to the Inessimetor, then fittine nat umber command of ('aptain Flinilers, for discowery amd survey of the Australion mast. In this explition, re bat the companimship of the dietimuthed botanist Lobert l'rame an! of his ramjutar Fordinand Bater, and from them $h_{1}$. 1 arned the great importance of the natural seicnes, in the pronotion of which he we aftrwarls tomk is lup am? intelligent inturest. On his return to Eugland, F. was apmintere to the beflomhme. in which he acted as sirmal midehipman in tho battlo of Trafalgar (Isins), amb had the ifnulfortune to eseape mohurt. He snhsequatly servel in the Bealforl in rarions statims. and thok it distin. guishom purt on the attack no x ew orleans in 1S14. In 1SIO, F. was despatchet liy eommonent to Hmison's bay, with orders to make his way thence to the Aretie Sea, aml survey as much of the const as possible. In the cemose if this expmitiom, which lasted about threc years am a half, $f$ travellea 5.50 miles under circomatances of the greatest haveship and privation, of whel more than halt of his compraions shecmuled. Jint the gain tor science was great, alike form the carefulness am! extent of the physical smerys of the month of the Cophemine liver, and astwand along Corma. tion Calf, and from the attention wroted to the natural prouluctions of these indement shoms. On tive return, in $1-2.2$, was male past-captain, and alected a Fellow of the Fival suciety. In 1sos. he (n-mperated (overnand) with the sea-expeditions of Captains Inrry and boveheg amb survered the Sorth Amoriman enast from the mouth of the
 diseoveries nows extembla owr 4 degrees of longitude, or mime than a thim of the distance between Bathin's Jiay and lebring's stant. Por these valualife explorations, in which he was chearel until 1827, he recerved the hanum of knighthand from his somerem, and the domee of 1).'. L. from the numersity of watord, whin the French 4 iouraphical Soctety awarden! him the ir mbl malal, and at a
 member of the Institute of france. F. next tork an active fart in the fireck war of lileration. In 1836, he was appointon whernor uf V:m Diemeni Tand, where his wise and moderate comiact secured for him the warm appwhation loth of the envernment and the colonists. The latter estaldished a college and a philosiphion socicty in his homomr ; and years after, they testitiel that the momory of his mule was still arntefully cherished, by suls. scribing dum towarls an experlition desirnel for his rescue. In Way Istis, Fo, now borkerimy on his coth year, but with physical and mental lowers

FRANZEN゚RRUNA, or FRANZENSBAD, a amall village and well-known hathing place in Anstria, on the 1 enth-western frontier of Johemia, three miles thorth-west of Lger, is situated amid low bare hills. amd consists of four rectamoular strects linet with treps. It has four cohl mineral springs. chictly of alkado-saline chalybate water, deened highly enticacions in the care of serofulous complaints and diseases of the skin, and usen principally for briaking, but also for lathing proposes, in which case the water is heated to a temperature of $90^{\circ}$ to $95^{\circ} \mathrm{F}$. Nearly 800,000 bottles of these waters are exported mmially, $F$. has also mud and gas baths.
FRASCATI, a beatiful town about cight miles cast-sunth-cast of Jome, with a popmation of 5ome. it stamis on the lower beights of the Allan llills, not far from the site of anciont Tuscalnm, which was built on a higher range of hills. Tusculnm (q.v.), a town of much more ancient date than Rume, was burned and ruined ly the fomans in 1191 A. D., to avenge a former victory gained by the: Tusculans in 1162. Those of the inhalitants who escaped the fury of the conquerors, songht refuec on the slope of the hill towards liome, constructime small huts out of the undorwod or frowele, amb hence the modern name Fraseati. The chief attraetions of F . are its lovely villas and salnbrions air, which attract from Fome in the hot season all its noble and foreign residents, and render this resort in the Alban Hills the most fashionable rilleggiontura in the vicinity of the Etermal City. The most splendid of these summer residences are the villas Aldohrandini, also known as 11 Belvelere, from its commanding and noble prospect; those of Mondragm and Taverna of the Burghese family; the villas Jallaricini and l'iceolomini.

The cathedral enotains a tablet to the Cardinal of York, for many years bishop of this diocese, and another to his lorother. Charles Edwarl, the Youns Pretenl.r. who died here in 1758.

## Friser. Smas. See Lurat, Lond.

FRASEI RIVER, the principal strean of British Columbia, comprises in its basin the far greater part of the colony. The F. IV. proper has its urigin in the union of two branches, the more important of which receives its waters from a series of lakes that lie in lat. it -5.5 N., loug. about $124^{\circ}$.n Wh.. flows in a denemal sonth-east direction for obin miles, and then mites with the other branch, which lass its somete near Nome Brown, in the lingloy Domatime, lat. $53^{\circ}$ N., luag. $118^{\circ}$ for W., thows north-west, ame is 200 miles in lwheth. The point of conthunce is near Fort Gempe ju lat. about $53^{2}$ S. S. and in long.
 gencrably suthem direction through nearly the
whole lenth of the enlony, and after a course of about 600 mines it falls into the crulf of deorgit between Vancouser's lslam and the manumd, burcly to the nurth of the international boundary of $490^{\circ}$ of latitume. Its chief aftuents are the stuant and the Chileotin on the richt, and the Thompson on the left. lintween the stuart and the chilcotin, and on the same sidt, the F. li. is joined by an atlluent, which is rather of historical interest than of physical improtince-the West lemal hiver, which tonk its name fromits having heen asermbed hy sir Alexamber Mackenzif. on his adventurous journey of 1793 from the Halson's bay Territories $t_{0}$, the lacitie Ocean. The Fi. k . is practicable for steam-bats as far up as Fort llone a distanco of about 150 miles from its month, while ahmot half that distance, as far as New Westminstrep, it is narigable for large ships. Above Furt llone, all intercourse is mome sately and conveniently conducted by land; and esen the alwriwines, as thair tritils still testify, aymar to have yidded to the sume nevesity.

In 1857 , the F . l.., in its auriferons disemess ant washings, begon tor stme forth as the riyal of Catifornia amd Australia. Sine then, the diseoveries, originally contined to the lower basim, have steadily brome at once more extensive and wore productive. Eastward on the 'Thmmpon, and more esperially northward among the muper waters of the ureat artery of the cumatry, the precious deposit has given ent :hmost fabuions returns. An apparently authentic eommunication, dated towards the close of Octuber lbot, regards the darily (aruings of :20) for one miner 'as joor this year,' and adds that, even as a hired latwurer, a man gets too a day. On the practical value of the gold-fichds, the peculiar eharacter of the $F, k$. exercises in various ways a powerful inthonce. Besides atfording comparatively fuw and scanty facilities for transpint, whether upwards or downwards, it directly embarrasses the workings themsclses. Cenerally speaking, the bed is a mere ravine, which rather drains than waters whatever lies beyond its wall-like banks. For operations on the high ground, therefore, the enrreut is rarely, if ever, available; and even the inner marins, thonled, as they periodically are, by the molting of the northern suows, are accessible during only half the year.

FRA'SERA, a genus of plants of the natural order (Qputhence, with a t-partite calyx and corolla, 4 stamens, aml a $\because$-valvalar capsule. $F$. I'elteri, a native of Carolima, Virgimia, and great part of the hasins of the Ohio and Mississippi, is oiten callel American Calumba, the ront leing imported into fourpe under that name. It is a pure and valuable bitter, similar in its cffects to gentian. The stem is herbaceous, erect, $3-6$ feet hich; the leaves oval, ohlong, oplusite and whorloh; the flowers greenish yellow. Tlat platit is a bicuniah. It grows in marsly $p_{\text {baces. }}$

FRASELIBERGEI, a burgh of barony and remality and seaport on the nirth coast of Alserdemshire, 42 miles morth of Aberbeen. It stands on the north-west side of a hay two miles in depth immerliately south of Kimnaird's Heal (supposed to we the Teticulurum. Promonturiutn of the liomans), on which is the Wine Tower, an ohe eastle with a cave holow, the town, wiginally called Faithly, was made a burgh of barony by Qneen Mary in 1.546. Its namm was changed into liraserburgh (in honour of its proprintor. Sir Alexatuder Fraser of lhilorth) ly king Iames VIf. in 1592; and the same ling. in loun, erected it into a free 1 mot, fiee targh of barmy, and ise reratity. The streets are wide and clean, with smbstantial kouses. l'ol'.
in 1571, 420:, which is greatly increaced during the herrmetishing in July and August. it is
 coast, which has lately been greatly extemled, and has ar patent slip attached to itu the chave exports are oat*, harley, meal, potatnes, pored hemrings, and conl. $F$. is now one of the most successfal herring tishing stations on the east const of kontland, the averate momber of hoats beine between 500 and (ino. Sine is in, it is commected with shordeco by rallway. E. has a handsome cross and town-homse in the principal symare, and a spacime hatl Jedonging to the 1l:arbour Commissioners. Sir Alexaminr
 mont of a college and unversity here, but the phan was never carricd out.

FRASLER, a strawherry flow ra is nsed ly soot. ha beraldie writars as synumpuns with a cimpucfoil: as in Mazonimg the eost of the lirasers, faure there fruses (Ninbet, i. p. 38S).

## FRATERKCUA. See IURTM,

buATICELLJANS, ar FRATICELTS ('Little Prethren'), a suct of the minhle asos, which may lee regaried as an amboliment, rutside of the medicual church, of the same spirit to which is dna, within the church, the Frameisem orler with its many ulfshots. The Itatian worl forticulli originally was the P品ular name of the Francisem nomks: lint, in the progress of the disputes which arose in the mider (see fiasciscass), the name was specially attichal to the members of the rigorist party, and erentually to those among them who pertanaciously refused to aceept the pmontifal explanations of the monastic rule, and, in the end, threw ofll all suligeotion to the authority of the church. Several of the pupes, especially Gregory LX. and Nichol:s III.. attempted to reconcile the disputants. lone Celestine V. grantel permission to the rigurists to form for themselves a separate organisation, in which the rule of St Francis might be olserved in all its primitive and hiteral rigur. The suppession of this order by Funiface Vill. apmeary to have furuished the direct oceasion for the secession of the extreme party from the church. They opeoly resisted the authority of the lipe, whom they proclaimed an apostate from the faith. The party thus furmed was increased by adhesions from other sectarian luolies, as the 'Beghards' and the 'Brethinen of the Free Spirit' (see Fise Spiatr). In vain Clement V., in the eouncil of Viema ( $1: 311$ -1312), put forward a new dedaration regarihes the rule of st Francis. They still helel their gromm, "specially in Sicily, Central and Northern Italy', amb lrovence. John XXII., against whom they sidal actively with Lewis of Pavaria, comlemumd thm $h y$ a special bull in $1: 37$, ame agin in a sinuilar ilocument ilirected against hemry de Ceva, une of their chief leaders in sicily. From these smores we learn that they regaded the existing church os in a state of apostasy, and chamed for their own community the exchosive title of the Church of foul. They furlanle oaths, and discomutemaneed marriage. They professed a divine mission for the resturation of the Gospel truth. They held that all spiritual authority was forfeited by sin on the part of the minister. It would even appear that tiny proceded so far as to elect for themathes a jope, with a college of earclimals, and a remular hierarcliy (Wadling, Annal. Min. Frutrum ad un. 1:\%4, u. 2(1). Their principles, in a word, serm to have partaken lapery" of the same fanatical and antisocial tomducies which characterised the Brethrea of the Free Spirit; and in common with them. the l: wro the oliject of a rigorous persecution about the mathle of the 1 the century. The principles of

 9 W. l'op abont li.u00. 'Hac town is pleasantly sitmatol, imble its wide streets arr prettily ormamonted with rows of orange, lime, banama, or conamit trees. The tomprature, as me may expect from the locality, is tolerably mifom, vary inf in aprosite seasmin hetwen the averages of $75+\mathrm{F}$. and $50^{\circ} 9$. Towads the interior, F . is enclosed by the mountain-chain from which the colony is designated, a position to which the proverbial insalunity of the climate is partly whine The population, exclusive of the anthoritits ami the garrisom, consists almose welusively of liberated nurgoes.

FliEE TRADE. This term, when used solate as twenty years ago, expreserl a disputel promsition, and was the badge of a politieal party ; it now :xpresses the most important and fundamental truth in political economy: From its simplicity, it afforls, to those who expect tu make whitical ceonomy an "xact science, the hope that they have obtanal at least one axiom. But it has in reality heen istahlished as the result of a lonble experience-the we being the failure of all deviations from it, the other the practical success of the 1 minciple durine the shont period in which it has been permitted to renulate the commerce of this country:
'Tradp comsists in buying and selling. There is free trate when there is 10 interfarence with tha: matural enurse of lonying ame selling, if such inter. ferener he intended to improse on otherwise tw influme trade. It is necessury to kerp this distinction in riew, lreanse there are may laws mot contrary to the spirit of free trale which interfore with buying and selling: for instance, in this mumtry, it is mataful to deal in slives, hecanse we do not acknowleage the right of one luman bina: to be the maner of another; it is manwfal to sell intoxjeating spinits withont havine ontained as licence beeanse the tax for the licence hrings revenue to th. Exchequer, and intoxicating liqumes are a commodity which it is arbisalbe to taz. in In ferene to the common necessarics of life. .w ern hammess luxuries. There are many of these last which camot be sold into this comotry withont paying enstmas duty, lont this is for the jurpoo of revenue merely, mot as a restraint on trinde.

The many attempts made by onemanents to reguate tratu for the purpose of henditing the commmities ofer which ther raled, may be dividend iuto two grat classes: the one prohilited the (xpmortation of commodities, the wher cheouraten! exportation, and pohibited or discousamed impare. ation. The fomer was the chl rule in this and in wher comentries. It was supposen that the Wralth of the conntry depended on ite retaming within itself erytain productions of native growth or inhastry, and their removal nut of the country was prohinitid or restramed. Tatil a late perichl, the "xpmention of maniuery was prohibitm; but this w: $\because=$ and ond remunat of the ond pincind",

## FREE TRADE-FREE-WILL

which hand yiched to its converse, in which it was manamed that exportation is the source of wealth, and impertation is a wasting of a nation's substance. On this theory the great body of Leritish commercind and linancial legistition, which received its deathblow in 194f, was foumded. liy it, a commereind community vas then likened to an isolited homan lecing phssessed of a cortain funl which he must of churse spend, so ns to beome so mach the prorer, if he luys commonities, whids to him is equivalent to a nation's importing thom. The motion was fomben on the analogy of the miser, whe will, of conrse, isurease his sture ly restricting his purchasis. Commmities, however, are nut in the position of the misur, possessing separate eapital, which he can protect and increase; they rather rememh the merchant who huys and sells, making a protit on what passes throush his hamle. Whatever monmunties import, they pay for ly expurts. This can be shown loy analysis in any class of uatima! transactions. If we pay for the goods we import log hills of exchanme these hills represent gemels exported, ntherwise they would not be paid. S'ee Fxchande. If we pay for goods in bullion, it is the same thing ; gold dues not grow in this comentry, ind every soverign we seme almond to lay for zonls lats been got as the price of pools exported, maless it have ben brongt by any of our own wolle from the end districts, and then it is vintialy a produce of lyitish imdustry. It is. in fact. is surt of dymanic law that importation canses exportation, just as a vacum in physies is filled up by arr, or the wother nearest thuil.

As applice to the mavimal imhandants, ame now to the nation, free trade is the right of overy man to do as he ploases with his calital and ahilities; aml as the general desire of mankind is to improve their conclition, and, in fact, the greater portion of them are thorongldy levoted to this nusuit, the interests of the ation at larte camot he in better lands than in those of men who, by increasing their own wealth, are increasing the weath of the publice. The progress made by this country since 1546 has afforded is wonderful experimental illustration of this truth, since the exports have heen triphed. They were, in round numbers, 40 , aud are now 120 millions. For more particular facts and circumstaners connectel with the establishneat of free trade, see Amemoris Law Leagee, Curs Lhws, Ctistoms.
FREEVIWILL. The freedom or tilurty of the will is the designation of a doctrime mamainei in opposition to another doctrine, cxpressad ly the term 'areessity.' The entest lotwen those two views has heen mantamed in the liblds looth of thenlogy and of metaphysics. The itea of a man being "free' in his actims appars first in the witings of the ancient Stones. Afterwarls in Philo Jutrens, an Alexandrian llatomict, wh frumished at the commencement of the Chistiancra, there owers an inguiry propoumded, "whether it be not the care" that the uright man is free, and the vicious man a slave.' 'This limguage was evidently meant to pay a compliment to sirtuc, and to affix a degrading stigma on vice, and onult not to have beea toin litarally interpreted; fur in strictuess it might have becen maintained, with eren greater fhatailility, that the vicions man, who defies all the restraints of serfiety, has the greater liberty of the two. The ductrine of frectom, as applied to the human will. was tirst contended for by Pelagins arainst Augustime's doctrines regarding the operation of grace ; and in a later age was the subject of controversy between Arminians and Calrinists, the Calvinists (such as Jonathan Edwards) having usmally been Necessitariaus.

Alhongh in this dispute thare are curtain poratis of real difterence of opinion letween the "pmsins parties, yet the froblim has been muecessarily chownhered with the unsuitable phasonowy thait has aceilentally investel it. 'The notim of "freedon' is intelligite when we spork of it free man as oplusel tua linssian serf, wo of a free press as opposed to emsorship; lat with reference to haman artions pencally, it has mo particular relevance: When a men, wede loy huger, atats the food that is hefore him, we reongise two sparate fonts, the ono leading to the other: the dirst is a panful fieline or sonation, the other a scries of musements bey whin foul is consogel the system; the no fact we call the motive, the other the action, of the will follow iner on the motive; lont them i.s pan propisty in duscrabing this sequenct as either frow on mote We may inquire into the preator on les cortanty of the sequence- mamely, whether a hanery mand does slways, as amater of course, avail lamedf of the food jurented to him, whe wher one may her sur hunsry with the opition of catin", and with no outher motive (rperating to deter frum the ant, now yet mot vat, thas showing an ahonee of mifom conncetion botwem pain aud the moments for allowiang it :
 on the actual coustitation of the human will; the 'fucstion of liberty and necessity does not prexut us su) much with an intilligible (question as with an artificial difticulty mate by inaphlicahla phatomoy It wond have been mond the same to have dispated whether or mot the will is rich, or moble or rowal, merely because the virtuous and rightomindal man hats sometimes her commented ly those epithets being applied tu him. The wod ' Wecessity' 'also, is ill chosen, in consmunce of its reat ambingity being applical sometines to lugial and nathe matical implication, as when we say the whole is greater than its part; smactimes the the reman uniformity of physical laws, such as cravitation am at other times to what is morely a hinh probbility. as when we expect that a man of lumarable and upright character will spale the truth on smat given oceasion. See Necharty.

If we east asite these comfusine phastus, ant ingure what is the real matter of dismate, we shail fime that there are intellinite lifferences of onmon in refercnee tor the sepmemues of human mition. It may be mantained that one actions have the same miformity as the successions of the physial wom: amd this view wond be supported liy a very wite induction of expremenc. It will be fomod that the whole of the compliater "prations of suciety chend upen the rertainty that men, in the same ciramstunces and umber the sum motiv", will net in the sane way: We allow for differmos of individual chatracter; but when ance tre lave sian what nuy man in dispoed to do in one instanco we take fur granted that he will he similarly actnated when the flentienl iremmetances ar" repeatel. The whale of our trading oprotions are fonmerl on the maxim
 and it hats never leen fomm that ayy furtion of and race has taken a waymad tit, amb comtrodictal itself on this fuint. We are propared for exephtions to the ruke, when other strong matives are juesent, but these are merely the intervention of an new foree mot the suaperasion of the law that comanes the other motive with its usual comsern mat. Nor is there anything demaling to hamoun mare in this uniformity; while the opposite state of thins would undermine all the securitics of lmman life, and hand us in a moral chacos. If hanum heings, who hahitually dread pains and pualties, were suld donly, fur no nilterior reason, to comart hanger ant cold, imprisomment and disgrace, it is obvieus that

Filititcillt (a word having the same origin as "fare' . the hire of a ship, or part of a ship, for the transport of murchandise; also the merchandise so
transpurbed. 'llo agrcement for the service is torumed is Charterpurty (q. v.).

If a nuerelsant frobight a whole ship, hut noulect t. sill it, the cantain is not at liburty so comple the arra from ether sourecs. withont acoometing to the merdant for any moness received for such admi. thanal lesul. Wh the other hatan, if the merelant covenant an freiflat a certain motimn of a ship, le is bound to pay the sme agread on for that protion, notwithstanding that his gonls may fail to oecupy su much space lif. in the elartoreparts. a day he appointal for sailins. and either tha morehant fall to have his pouls rady fur equmakation by the time tixed, on the vessed be umpreprated to start-wimi and weather permitting-the arecment may bo declared void ly the agerieved laty, who can alsur reoover at law for any detriment cansed to his property in comsequence of the mblay. The wse us chartereparties has heen traced back as far as the reign of IICBry 111 .

This contract, whieh in Enpland, aml gencrally in the commercial langace of the country, is callend freight, is mome commonly spolicon of by the legal writers of Scotland as Alfrightmont, from the French affetement (bell's Com. i. p. 414), but there is no essential dineremee in the laws of the two countries with reganl to it. Throughont the whole commereial worhd, indeed, in so far as its provisions are not made the subjects of positive stipulation either ly Charter-party or Pill of Laling (9. v.), they will be beld $t$ o be in accordance with the usage of trade, and of that particular branch of trade to which the hiring has deference.

It was formorly held that the pament of the wages of the crew was continerent on the earning of freight hy the ship, in accordance with the maxim of Lorl Stowell, that freight is the mother of wates.' But this rule, which was already subject to many exceptions, has been abrogated ly the Derchant Shipping Act (17 aml 1s Viet. c. 10t), and wages may now be recoverel cither by scamea or aprentices. even though no freight has been earned by the vessel. The suaman has a right to chilir to the last phank in satistaction of his wares: hut in cases of ship. wreck, his claim for wases will be barred if it be wrovel that he chil not exirt himself to the utmost to save the ship, carco, and strres. This provisiun was tirst introduced by 7 and 8 Viet. c. 112 , s. 17. which enacted that, in order to enable him to recover his wares, the seaman should be bounsl to produce a certificate from the master, or ehief surviving ofincer of the ship, to the effect that be had so exerted himself. By s. 183 of 17 aml 15 Vict. c. 104 , the onns of proof is rery properly laid on those who impugn the conluct of the semman. The old rule is still adhered to in America, but it is not appled to the master, and it loes not lold with reference to seamen, if the freight has been lost by the fault vither of the master or owner: e. if the ship has been seizel for bldit. or for liaving contraliand gools

FEEILLGJiATH, Fembicish, a brilliant lyrie poet of Germany, was lorn at letmohl, in the jrincipality of Lippre, 17th Jume 1S10. He attencled the high school in his mative tom till the year ISO.5, when he entered a merchant's ufice, first at Soest, and afterwards at Amstemlam. Encouraged by the favourable reception of his proms, he ahandoned mereantile pursuits, marriad, and removed to Darmstalt. In 184\%, a pension was bestowed upon him by the king of Irussia, wherenpon he removed to st (roar, on the lhime, This cirenmstance, and his poem Ius sponion, deprived him of the sympathy of the liberal party, which, however, was restored to him trofuhd when, in 1544 , he gave up his pension, and in his political poems attached himself to the
democratie party. The phblication of his Claubensbekennthiss (Confession of F'aith), in the sante year, compelled lim to take refuse alroml. Ne went to Belgimm, Switzerlaml, annl in 15 !6, to Jomelon, where Le resuubed his mereantile pursuits, anul herame correspondent for the bankinghouse of lluth \& ("o. Ile was about to acmept an invitation to Ameriab, sent him by Lemerfllow, when the evonts of 18.18 recalled him to his native eomatry. $l^{*}$. settlen in Disseldorf, where he became the nost inpurtint momber of the democratic party, whl saniog the pratises of democratic sucialish. FRESCH POLISHING, the name given to the now conmon methol of coating wool with a fine smonth surface or varush of gum-lac. fum-late is easily soluble in spirits of wime, methylated spirits, or wool-naplatha, ame a marbish is thas produced; but if it be applied simply with a brush, as eopal, mastic, and most other varmishes are applied, the result is a very rongh and broken surface, instead of a smonth contimuons pulisl. To obtain this with a lae-varnish on wool, it is necessary to aphly a very small quantity at once, and to rub it continnonsly until it dries. If a dry zubber be used, the lac sticks to it, and it is dracued from the wood. An oiled rubber is therefore nsed, and the oil should be a drying ril, such as linsed. Varions kimels of rubhers are used; such as a ball of wonl covered with rag, a small roll of cloth with the edges downwards, and likewise envered with rag. The varnish and oil may he mixel together in a bottle, slakken "p when used, and a little poured upon the rubber; or a simple sulution of shell-lae may be used, and some of this lail upon an vilen ruliber. Several successive coats and rubbings are required, and some skill is necessary, in crder to produce a good surface.

The following are some receipts for French polish for mahogny they might be multiplied to a great extent, for they shoulal be moditied acendimer to the kind of wowl to which the are apllich, and the mode of apllying them: 1 . in oz of prate shell-lae, dissolven in l pint of wool-naphtha, "I methylated spinit, or spints of wine. 2. 5 of of pale shell-lac. I $0 \ldots$, gum sambarae. 1 pint spirit. . B. 1116 , pale shull-lac, $\frac{1}{4}$ Ih. mastie, "Quarts spirit. 4. Shell-lac, 6 oz. : spinit or nophtha, 1 pint : linseed oil, $\frac{1}{6}$ pint. The last is the most asy to aply; it requires no ail on the rubber, and is a very good domestie phlish fin restoring furniture, if properly applied by coreful aud contimoms rubling.

## FRENCH SETTLEMENTS-FRESCO, FRESCO-PAINTING.

It has a rapid course of ahout sixty miles; and, towards its mouth, is so uniform in lreadth and depth, as to resemble an artificial ant throngh bare rock. It forms gart of the route ly which causer, preferring the ottawa to the st Lawrence. pass from thontreal to the Fied hiver of the north.

FIENCH SETTLEMENTS. Se Posm cmerer.
Fremoñ, filaf Chmemen, a French writer, was born at (!umpur in 1719 , educated under the Jesuits at the rollege of Louns le Girand, and first acyuirel a rematation by his puldication of a critical jumpal in 1746. This journal appered umber the curions titlo, Lettres de Maleme lé'montesse h * * It was surpressed in 1749, lut virthally reappeared as Lethes sur grelques Leritsede oe Temps ( $1: 3$ vols, 1749-7.54) aml was again enntmoed unler the title of Amér Littercire ( $17.5-1576$ ). F. exhilviterl the must intense hitternoss aqainst his louling contemporarics. A worshipper of the age of Lanis XIS'., he hated and satirised the levelhing philosophy of his times. Voltaire was the special ubjeet of his aversion, and that sensitive scoffer was deeply galled Ly the weokly diatribes of his antarminst. Thi names of Voltaire and F . are inseparahly, though mot amieably, conjoined in the history of literature. F. was often right in his eriticismes and in the acelasa. tions which he brought against his adversaries, but opinion in France in the lith c. was swayd ly epigrams, and F. fell a victim to the ammesity of the wits. He died of grief, March 10, 17a6.- Lints Stanime is Freron, a son of the fumer, was born in Paris in $1760^{\circ}$, played a somewhat prominent part in the melonlrama of the French lievolution, and in 1802 was sent as sulbrirefect to the island of st Doungo, hy the First Consul, but died two months after his arrival.
FRE'SCO, FRESCO-PAINTIXG, m P.UN'TING IN FlRESCO, the term applied to paintinus executed upon plaster while it is still wet or frish (Ital,, fresco). Nany celebrated artists and wellknown writers have maintained that fresed is the only way in which the highest efforts in art shoult be embulial. A very large proportion of the lust works of the ltalian shoods, particularly those of Lome and Florence, are done in this manner; and during the present century it has lmon reviven, and many of the chief printings of the mokhon treman schorl are executerl in fresen. The practive has to some extent lreen introlaced into Dritain. and rertain worlis of that kind have heen oxectited, aml others are in progress, in the new llonses of Parliament.

Fefore noticing mone bartionlarly the varimas properties edaimed for freserpanting, it is Lraper tirst to describe tha process. A cartom on draw. ing on paper is first made wi the sulngeet. This must he executed with is correct matline, and the slanding and ethent fully manke ont. The finishel cartom may either be of the same size ats the intemped freseo, or it may the done on a smaller seale : int, at all events, an cuttine of tho same size ins the frosenpaintiner is necessary. When the timishad cartom is made the same size os the freson, it is cern rally executen in luack and white, with chath or charcoal. but it is essential to have also a carciul stuly of the suljeet in colours, and this is in must cases done on a small seale. The colours used are mostly earths or minerals, as few others will stand the action of lime: these are gromd and appled with pure water. The gronnd tolne painted on is the last or smouth roatine of plaster that is lan over the rongh plaster-work with which walls are preparel. This last coating, or ground, or rather as muel of it as the artist calculates on being able to eover in one day, is laid
on immediately before he commences work. The surface is wet, lant firm and smoath; the tracing is latil wer the protion frelarch, and the artist, with a joint of hard woul or bone, gots wore the lines of the tracing, and slightly indants them on the flaster. Ho then puceeds with lis work, the finished carthon aul colourol sketch heing hung or phace near him for his ghenance. After his day's work is mora any furtion of the phaster that has mut herel| aninted un, or that may remain heyond or at the aike of his work, is cut away; and next day, when the paintur is realy t" commence work, the plast rer is at hame, and joins closely another !nertion of plaster to the edy of the pertion painted ont the furwing day, which, when eut, had been slightly shomen. The lime, in drying, threws unt a kimp of crastal surface, which jmotects the eolemer, and imparis is dugree of elearness much sumrior to, amd menily distimgushable from, that of a work in tempara in size paint. This pocess, althourh apharently simpla, anvertheless requires great elextority and cortainty of land: for the surface of the jlastor is deluate, and must not he overworken, besinten, the lime muly imbiles a certain quantity of anditional mansture in the form of liquill colours after which it lases its crystallising puality, and the surface or a portion of it, heomas whit painters call rotern. Many frescones are lumetion in this way. It in unly after the lime has ifriml that sucla flaws are dianowned; the proper plan, in such a case, is to eut away the defretive furtion. have fresla flanter lail mond d. the wirk wer again. Put the flaws are tom often retmobell with tempera or size colours; and though they may cesape notice for a tim". the farts tonched will change ur come off in the course of a few years. Another difficulty in fresen is, that the colous beome much lighter after the plater ilins, and for this allowance must he male. Howeror, ly practice, the painter may sonn get wer this dithicilty: and lie can test the lifference between the colonr as wet ami as dra, lif putting a touch on a piece of maber he has generally at ham, which instantly drips the colow, and shews it as it will he when the lime has dried.

The preeminence claimed for freson-panting is fomuled on-k. The quality it prossesses of channass and exhibitins colontrs in a dure and hight state. The surtace net heinit dry and dull, as temgura or sizo colour, nu chosy like wilpantins, is
 $\because$ Its duralility - many frescons lexine painted wa arables or the dejsters of churbose aren on me silt, soma on the irnta of homses entirely expused it the oforair. 8 . The skill and deaterity mpamad

## FRIEDLAND.

the constant and regular friction of mestion that is of much consequence in practice.

Friction is very much diminished by the use of grease or unguents. The coeflicient of wronght iron upon oak, which, in the dry state, is '49, is reduced by the aplication of water to "26, and ly dry snap, to $-2 l$. The result of experiments on this subject is stated to be. 'that with the unguents, hog's-lard and olive-oil, interposed in a continuens stratum between them, surfaces of wood on metal, wood on woml, metal on wood, and metal on metal (when in motion), have all of them sery nearly the same coeflieiont of friction, the value of that coeffiefont being in all cases included betwen or and '08.' Tallow gives the same coefficient as the wher unguents, exeept in the case of metals nom metals, in which the coefficient rises to 10 . In the case of wood on wood, black-lead is frequently empleyed for the same purpose.

The most important fact, perhaps, and one that conld hardly have been anticipated hefore experiment, is, that the friction of motion is wholly indeperdent of the velocity of the motion.

The resistance to the motion of a wheled carriage proceeds from $t$ wo sources; the friction of the axle, and the inequalities of the road. The resistance of friction to the turning of a shaft in its bearings, or of an axle in its box, has evidently the greater leverage, the thicker the journal or the axle is: the axles of wheels are accordingly made as small no is consistent with the requiral strength. 'The resistance that occurs hetween the circumference of the wheel and the road, constitutes what is called rolling friction. There are on all roms, to a greater or less extent, visible rigin prominences, sueh as small stones, in passing over which the wheel and the load resting on it have to be lifted mp against gravity: But even were these wauting, the lardest road yichds, ame allows the wheel to sink to a certain delth below its surface; so that in front of the wheel there is always an eminence or obstaele, which it is at every instant surmounting and crashing down. This is the case even on iron rails, thougle of course to a much less extent than on any other road. Nuw, for arercoming this resistance, it can be shewn, on the principle of the lever, that a large wheel las the advantare over a small ome: and by mumems experiments, the fort has been fully istablislaci, that on horizontal roads of unifom quality and material, the trempmen aties diveelly ets the load. and invers ly as the radius of the mhtol.

The leset direction of traction in a two-wheded carriage is not parallel to the road, but at a slight inclimation upward, in proportion to the alepth to whiel the wheel sinks in the rnal.

On a perfectly wns and level macadamised rome. the traction of a cart is fomme to le $\frac{3}{3}$ of the load: that is, to draw a ton, the horse remaires to 1 muli with a foren equal to 7.0 llog . On a railway, the trantion is reduceal to giso of the lond, or to 8 lids. $1^{\text {ner }}$ ton.

While fristion thas acts as an olstruction to motion, and wastos a furtion of the motivoporer, it has also important uses. It is, in fact, an indin. pensaldon matitions, wo less than gravity, in the stablity of wary structure, and in every merhanizal motion un the euth's smface. How essential it is to onv own mownents, wexperionce when we try to walk on ice. Vien on ien there is still consideralle friction, so that one font fan he sliphty andwacel fefore the other; wore it altogether aumililated, we conld not stir a fraction of an inch, erensuppos. ing we conld stand upright. Without friction, a ladder eould not be planted against a wall, maless there were a lowe in the gromm to retain the foot. In short, no oblique pressure of any kind could
le sustained. The advantage of railways consists clicfly in the dimination of friction; but wre this dimimation earried much further, there conth he n" motion whatever, at least by means dif locomotives. Witlont monsilerable fridtion, the hriving-whets of the lemmotive wond slade romm on the raids withent advancing ; and this scmetimes harpons. when particular states of the weather render the rails an if they were greasul.

Ihe force of friction is often dirently empluyed in medonies. It is used, for instanere to enmmunieate motion by moans of belts, chains, fe. It is the fore that bulds a knot. It is specilly usciul when a madhine, with great monentum, hats to be checked or arrested in its motion. The luest example of this is the breek used on railways. ly means of a system of levers, ldocks of wond are mimh to jubss aganst the eiremafermen of anmmer of the can-riase-whects: and thos the monentmo of a train wrinhing hundrods of tons, amt huring with it velucity of perbaps 50 miles an hour, is andually destruyd in a wonderfully short space of time.

Priction-wheds are employen to diminish the friction of axles on their supports. 'Twa whels, of large circumference in propertion to their wojnt, aris phaced close together, paralles to weln outher, and so that the one seems to urerlap the half of the other: in the motel thas fommel ly tho upper cir. cumferences of the wheds one end of the avie rests; a similar arrangement being made for the other end. The friction, which fommerly ated olirectly on the axle, is ly this arrangement referred to the axles of the friction-wheels. aml is, lix the litws of medianics, reduced in the ratio of the circumference of the friction-wheel to the circumference of its axle. In orilis to render the friction of the friction-wheds themselves the least pussible, they are made as light and as large as is practicable.

 vichons. Kiuw, a rightly comstituted frimully society is loound to adrett to this viremotance. 'iow admit all ages at an "rual fayment. is cloaly makine the
 have entered at an callor age, and heon paying all alune.

Another preat error in the comstitution of lenefit socinties is in making them for a yar unly. feorly sociofors, as they are called, natally minate with some individual - iften the keper of a tavern-who ahrestimes that as suricty will he formed in his house un a particular day. Applicants for admission pay whe shillime as entry-mber, wheh gres into the whet uf the uriginator of the schome by way if rent. The wijects are sencrally threefoldnambly, a fand for sidoness aud funeral expenses, a dipsit fumb. and a lowa hank. Towards the first. there is protajs: weekly pryment of twobence, or more if neessary, together with the
interest arising from the lom of money to the members. Jumarels the depmsit fumi, there is a payment ranging senerally from sixpence to two shillings, the accumalations being received back When the suciety eloses. 'lhe monery deposited is employed in making loans to surh of the members as lesire such aceommonlation, within the amonnt of their several entire deposits for the year, one fenmy fer pound per month leiner chanemi ly way of interest. The surplus if any. of the twomences and interest, affer sick aml funcowl mentey, beroks, aml otler necessuries are paid, is divilud amonerst those members who may $I_{m}$, lase of the lowks at the chase of the suciery", 大"on such surictios aro formed

 the temptations of a tarem: bat wome of them avoil tha erross of an "faality of patyonts fors all ages, and the yeury dissobution. Shumbl sickuess befall any one townels the elose of the year, he is
 for, because he cannit enter another saciety in a state of sickmess. Comsilured as a hepmsit for sarimes, the yearly society is strikimely inforior to the savings-limk, in as fiar as the chensitor connot take ont money without paring all exorhitunt rate of interest. Finally, theese sucieties are gencinlly wher the eare of rosecure persons, who can give no secority for the fomds placed in then hands, and who in many instances lnerme lankrup of abscomb before the final reckonime. learly sucteties are, infecrl. in every luint of view a most ohjectiomalal clans of institutions, to wheh wothing-people worlil never resort lut for their inmorance and nowarimess, and the tempitations helol bit to allare them.

A well-constituterl friendly seciety involves, in the first place, the principle ot bayments apmopriate to particnlar ages, as no other plan can be consindered cquitable. It stamls forth lofore the workingclasses as a fermanent institution, hike the lift-itssurance sucieties of the milille ami upher classes, and necessarily reguires its members to consinler the connection they form with it as an endurins wne. becanse its gram am is expressly to make provinion, at one prexind of lifes for continioneles which maty arise at another-youth, ju short. to enctow nlal aces. By a yourly suciety, a man is left at last no bettor tham he woss at thost. as fire at that socinty is cmmcermed; but the phoner fromily society emona. phates has emjorimer a comatortable and minebembent ohl ase, from the results of his own well-bestowerd camings.

It is essential th the charictere of al proger lemefit socioty that indirinluals he met ahmatted imissoriminatily. To talie in a ferson in had latalth or of broken constitation, is unjunt to those nembers who are healthy, beotuse lee is whonsly mode likely to be a sperely hurden to the fumbs. Ileme as in lifer assurance sucietios, it is neressiry to armit momiors only mon their shewine that the are aitanme ennstitution and in the anjument of enombleath. Aud it may las well to erant mo leantits matil after the momber las lewn at yane in the sonewty liy these means, men ate indiued to meat when they are hale :anl woll, insteme of pent pumbe the step matil they have a presshar need for asistance.  paractl of that which Mr M Marles Ansell proptowl

 sulisisting legislation rerareling them was repealed
and consolidated by 15 and 19 Vict. c. 63 . By this act, three registrars are appointed, one for England, and one for Ireland. both to be barristers, and one for Seotland, to be an adroeate; all of not less than seven years' standing. 'The salary of the English registrar is $£ S 00$, and those of the seotch and Irish registrars $£ 150$ respectively. Under the provisions of the act, any number of persons may establish a friendly society, by snbscriptions or donations, for the following objects. '1. For insuring a sum of money to be pait on the birth of a member's elidel, or on the death of a member, or for the fumeral expenses of the wife ar child of a member. 2. lor the relief or maintenance of the members, their husbauds, wives, children, brothers or sisters, nephews or nieces, in old age, sickness, or witlowhood, or the endowment of members. or nominees of members, at any age. 3. For any lurpose wheb shall be anthorised by one of her Dlajesty's principal secretaries of state, or in Scotland by the Lord Dilvocate, as a purbose to which the powers and farilities of this aet onght to be extended : providet that no member shall subseribe or contract for an anmity exceding thirty pounds per annum, or a sum payible on death, or on any other contingency, excectines two humked pounds.' The rules of the proprosed society must be transmitted to the registrar, whose certincate to the efleet that it is in conformity with law slanll constitute it an estalished society from the late of said eertificate. Somoney is to be pain on the death of a chille, without a cols of entry of the resistrar of leaths; and by the suibsequent inct, 21 amd 22 Vict. e. 101, s. $\because$, it is further prusialed, no payment shall lee made on an insmance on thi death of a child mbler ten fors of age, for fumeral expenses, without a rertitienta, signetl hy a pualitied medieal practitionol, stating the probuhle eanse of aleath. The smms payalle for the funcral exponses of a chiled umber tive are mot to exceet du, wo for a child above five and wnler ton, allo.

FHildNDS. NDCIETY GF, the prome lesignation of a stect of Christi:ns, Jotter known to the gemeral commonity ly the mant of (!utkers. Their fommer was leoree Fux (t. v.). bum at Draytom, in Leicestershire in $16-4$, who at first fulluwed the oecuration of a shomakir, lat afterwards ilewoted himself ta the moparation of what he regrated as anmoe miritud form of Christianity than prevaled in his day: In spite of savere and evan persecotions, the suricty of $F$. sucecelad in establiching themselves luth in England amb America. They Iave, imeded,
never been mamerially pwerful (baving at no time excecten $2(6,000$ members) ; lout the purity of life which from the beginning has so homenably distingushol them as a class. has umpuestionally excreised a salutary intluence on the public at larece; while in respect the ertain rreat prestions affecting the interests of raakind, such as wotr and sharem. they have. levond all elmbet, originated opinions and tendencies which. whether sumd or trroneons, are no longer continel to themsndee, but have widely leavenel the mided of Christeadom. Fir an accumt of the roore eminent representatives of the prients, see the hiographies of Paseliy, Fox, lexy, ied We comfine curselves here to a brief notice of their doctrim: practio, and discipline, as it is laid down in their own mblications.

1. Dectrin.- It is perhaps more in the spirit than in the loft, of their faith that the somiety of 1 ". difler from other erthond Christians. They thomsotves assert their helief in the great fundanental facts ni "hristianty, and even in the substantial identity of unot of the loctrinal opinions which they hode with those of other evagelical demominations. The binstle madressed by bearge box and other Friends to the governor of barbados. in $160^{-3}$, contains a confossion of faith not diflerius materially from the soncalled Apostles' 'reenk, except that it is more copnonsly worded, and dwells with treat diffuscuess on the interaal work of christ. The Declaration of thristian boctriue given forth un belalif of the suciety in 160\%, expresses a helief in What is usmally terned the Trinity, in the atone. ment made by Christ for sin, in the resureetion from the dead, and in the doctrine of a thal and eternal judgment ; and the Declaratory Ninute of the yearly meting in 1020 anserts the inspiration and divine authurity of the Old and New Testament, the depravity of human nature conseguent on the fall of Adam, and other characteristic doctrines of Christian ortheduxy, adding: © Our rehgious suciety, from its carliest estallishment to the present day, has recened these most important doctrines of Holy Scripture in their plain and obvinus acceptation. It is newortheless certain that uniformity of theo logical opinion cannot be predicated of the Friends, any more than of "ther boties of Christians. As early as bibs, William I'enn and Gemre Whiteheand held a public disenssion with a clergyman of the English ("hureh, mamend Vincent, in which thes mantainel that the denctrine of a tri-personal dom . as hede by that charch. was not found in the seriptures. thomeh in what form they accepted the alactrine themedves llimes not appear : and sumu time latur. l'eme publimbel a work himedf, entoted

 amivers to the questions-to avoil thendratal doumatism-are taken from the Bide itself). This halit of allowing to each indivitual the full frecton of the scripitures, has, of course, rendereal it all the more difficult to ascertain to what extent indivilual minds, anons the Socinty, may have diftered in their mole of aprehending and doymatically explaining the facts of Christianity. Thenr princinal distinguishing doctrine is that of the 'lieht of Christ in man,' on which many of
their nutward peculiaritios, as a relimons lwoly, are grommel. The doctrine of the intornal light is fumben on the view of Christ given ly Nit down, who, in the first chapter of his andul, describes Christ - the litemal Lowes-as the 'life' and "light of men.' 'the true light." " the lingt that bighteth every man that cometh into the world, \&". barclay tanght that even the lacathen wore illanined hy this light, theogh ther might mon know-as, indeed, those who lived trefore Christ comhl not knm-the historical Jesus in whom 'hrintians belneve. In their case, 'lurist wat the light shamer in darkness, thmuth the darknes compremmal it not. 'The existence of 'natural virtue' (as orthondox theologians torm it) amons the heathen was lenienl ly Barclay. who regarded all such virtue as 'hristian in its essmoce, aud as proweding from the lisht of Christ shming through the darkness of pagan sumerstition. These opinions would seem to be sumewhat frecu than those expressed in the Creneral Epistle of the suciety $l^{\text {milalishet }}$ in 18 Sh. wherem they refuse to anknwledse 'any principle of spintual loht, hif, or holiness inlerent los nature in the mind of man,' and again assert, that they 'le-lieve in no priveiple whatsoever of spiritual light, he or holiness, except the influence of the 1HWly sirit of God brstown on mankind in various measures and legrees through Jesus 'hrist our Lowl ; lut, on the ather land in a little treatise publiahed ley the sweicty in 1S61, it is atfirmal that the Holy spirit las always leen afforded in varions measures to mankind;' while stress is also laid in the statement of st Paul, that the grace of Goul (umlerstome by Friends to signty the "oneration of the Divine spint') that bringeth salvation, hath "phected to all men;" while anuther expunent of their views, Mr T. Erans of l'hladelphia
 (irithin \& Co, lasio), states that (Goul hath granted to all men, of whatsoever nation on contry, a day or time of visitation. Aloring which it is pussible for them to portake of the lenolits of "hrist's death, anl he saved. For this end, he hath communicated to every man a measure of the light of his own אom, a measure of grace or the lloly spirit. by which he invites, calls, exhorts, and strives with every man, in order to save him: which light or urace, as it is receised, amh not rusistel. works the salvation of all, even of those whe are ignomant of Alam's fall, ime of the death and suflerints of Christ; luth lay hringins them to a sense of their own misery, and to lue sharers in the sufferinge of Christ inwady: and hy makng then partakers of his rasurvetion, in ineoming holy fare and ri-htoms. and recoserel out of their sins.' Hence it may law safuly aserten that they hohl a henarder

This species is noarly six inches long, and when cooked resembles chicken.

## FROG-BIT. See Myprocharidex.

FROG-FISH (Retrachous), a genus of fishes of the family La, heitue, to which also the Angler (q. v.) or Fishing From hoones. They are romakalde for exerssive ugliness. The head is largur than the body; thattened and spiny; the month is very larse, with many teeth; the lips are often furnisher with filaments; the pectoral tins are supported ly a short stalk or wrist. The skin is naked in some suecies, sealy in others. The species are mmerons amd widely distributed, lout none of them is mitish. They hide themselves in the sand to surprise their prey.

FROGGED, a term used in rgaxd to uniforms, and applied to stripes or workings of lraid or lace, as crumeuts, mostly on the breast, on thu pain cloth of which a cont is made.

Froissalet, Jens, a French poet and historian, was born at Valencionnes, in the year J33:. Being destincl for the church. he received a liheral educition, hut somn displiyed a passion for furetry and the chams of knightly sucicty. At the age of 20, ho began to write a history of the wars of his time, aml male several jouncys to cxamine the theatre of the events he was about to relate. The composition of this work, which furms the first part of his Chronieles, ocenpied him abont three years ( $1357-$ 1360). On its competion, he went over to England, where he was reecived with great favour by Philippa of Hatinalt, wife of Elward III. In 136 , she appointed him clerk of her chapel and secretary: Two years afterwards, he visited Sentland, where low heeame the drest of King Davil Brace, and also of William Earl of Donglas. Everywhere the gay, poctical, quick-witted, and shrowdly ohservant Frenchman was welemed and honomred. In labit, lue aecompanicd the black Irinee to Agnitaine and lempeax. Hle afterwards went with the buke of - laronce to ltaly: F., alony with Chanere and Ietrarch, was prisent at the marriage of this prince. at Milan, with the danghter of Galeazeo Visemoti, and directed the festivities given by Andeus VI.. of Savey, in homme of the duke. On the death of lis protectress lhilipha, $F$. Gave up, all connection with Eugland, and, after many alvontures, enterent the service of Wenceslans, Duke of firabat, as private secretary: The duke was himself a pnet. and F. mathe a collection of his verses, to which he addel some of his own, and entitled the whole Mchiulor: ${ }^{\circ}$ the Knight of the Goldens S'm. On the sleath of Wenceslans, be conterel the service of Guy, Coment of Blois, whe enenuraged lim to centinue his ('lumicles. He now tork a journey to the court of Giasten f'hebos, ('ount de Foix, that he might hear from the ligs of the knights of Dean and hascony an account of their exploits. F. alse made several other journeys, to collect information for his Chronicles. In 1:394 he obtained the canonry and treasurership of the collegiate church of (himay ; in the following year visited England, where he was courteonsly and generously entertained by King Richard II.; and on his return spent the remainder of his life in completing his great work. He died at Chimay in $1-110$. F's Chronicles embrace the
events oenuring 1320-1400. They are valuable donmonts for fllustrating the character and manmors of his usce The javentry of fomial times hrieftens his prages; the din of ams, the shomting of knalits, amb the marshalling of troops, is rever and anm locard; while 'risions of farr women' rise before us is we reand. FROSNKONE（the anciont Frosinn of the Volscians）is a town of Italy，in the states of the

Church, built on the slope of a hill above the jumer tion of the river Cussal with the sumen, about is miles east-somtheast of Ionue. on the liantroma between lome inal Naples. It is the "apital of at deleration of the same name, which is motorions for brisandate. The only interesting edifices are the palace of the pumal the egate and the remains of an anciont amphitheatre. "The costumes of F . are among the mest admired of Italy. l'il. ahout Sillo.

FROST-BITE is causcd by cold deqressing the vitality of al part or the whole of the lowly. The frost-liatem part is at first hane amel jully, from tha, coment of home through it homs sumental; then, shombl the cold be contimul, it hecomes pallibl, and the panful tinding gives place to mombers and insensibitity, and finally to actual tuath or mortitication. Ahbmuth a sudden volunt applatation of cold may panse death of the tismes, hy reducine the tempratare to a degree incompatilib with anmald life, the most common canse of the destructive effects of frost-hite is madonlitedly the excessive reaction which aceursom sulden removil of the cold, or the application uf heat; this is espectally the casb with muist coll.

Burn Larry lndieved that 'oold was merely the predicjosing canse of frost-hite, and mentinis that after the battle of Eylan the French sodiers dial mot experince any panful sensatims tharing the severe coll rarying from lo tor 15 belaw zew of Reammers thermmeter; but when the temjerature rose from IS $^{3}$ to 20 , they fult the dirst sensations of cold, ami applied for succomr, complanins of acute bains in their feet, ant of manbs ness, heaviness, and prickings in the extremities. The parts were scarcely swollen, and of an olseure red cohme. In some cases, a slight rechess was perceptible ahout the roots of the thes, and on the lank of the foot; in whers, the tines were destitute of motiom, semsibihty, and warmth, boing already hack, amd, as it wore, drimh.' Those of the men who indulged in the warnth of the hivonar tires sutliced from frost-hate in much latger pronertion than their mure hardy comrales.

In this comatry, abost chacs of frosthite ane very
 Oceasimally, in sewore winters, more severe cases prement themselves at the hompitals in the prissons of honsihess, ill-murishem] mufurtanates, whense anstitutions hase in many instances heco enfedhed by : Mrit-4ninkine

Tlue treatumat of frost-lite cmasist in coaving back ley deseres the vitality of the part; this is most pablently collected by friction, at first with show, then with water at ordinary temmerature, no wanth locing applael for some times. As the whluess sulsiala, tha painful tingling returns, than
 be alowe the nathral stimdari, and if not mond rated, the part will intlam. and perhaps mortify. It is well to romember that the part need not have buen actually irwan for these symptums to weme. The fersan with languid cirenlation who, coming hame with moll wet fent, places them before the tire, in' in warm water, may be 'frost-litten' to all intents and purposes.

FROTH-JLY, FIOOTH-HOPLER, FROC:

 amd versatile Italian poct. was born at Gemon in

 lue hanl alreanly acyaimed the reputation of heingrat Clegant writer of pome insi versa, butly in Latin ame ltalion. In 1719 he taturht in Gomon. amd
 thanme the patronsen of the ('indinal lantivorlio, he was appointed jont laureato. the stated amd puseriben compusitions of which phst were highly buconeremai to his miginal and disemrsive muse; nevertheless the lonkes of l'ana showel prarticular favome tor the poet, wha retmenel to ficmon on the reath of bukn Intonio, and the aceession of thr Sumish Infanto. In I733, Jopu Clement XII. rebeased 5 . from lis piritual vows, which lisul at all times beon highly ristasteful to him. A rrand ode, in celelmation of the capture of Oran by the Sbaniards, and some other poetic addresses to the king and furen of Spain, rejustalleel thes port in his fomme lust at the Parmese court. He died in 176s. Nis mumanous writings ware publishal at lomma, 1779 and a complete calition at Lucea, 175: A selection from his works apreared at lirescia, 1780.

FILUI' (fouctus), in the botanienl nse of the term, in jlianerogamous plints, is a mature ovary containing a seed or serols ; and in cryptogamous plants, a spern-case (*poryngum on thent) containines spures. Other pats of the llow ar, most frequently the caly $x$, sometimes romain after flowemore is oser, whereor a futher development, herme incorporated with the ovary, and form part of the fruit. The development of the fruit in plancrogmones plants depents upout the fertilisation of the wales, amd when this has not taken place, tha flow of sap to the owary usmitlly somb ceases, and it drops ond with all the other remains uf the bluwer ; althomel there are exceltimmal cases of seedless fruits, is sempless manures, bamans, grapes, humbries, de. in which, however, it may be supuosel that fritilisation takes plater, and that manown canses afterwarels operate to pre* reut the develonnent of the sced, and to direct the hlow of sal more exchusively to the nourishment of the sucenlent prarts, whid are thus increased anl improsed. This supposition is rembered more probalilu ly the eiremostane that the production of soclless fruits alplens: to he at least sometimes it comseruence of are and diminished vigour in trees.

The frait, like the oviary, may be commosed of one carpel, or of more than wne. But the fronit sometimes difios from the wary, through the development of some of the parts, and the mon-develpmatist or ohliteration of whats; so that an ovary with suveral colls may be emoverted into a mesecelled fruit: and of several owales, all lint one may become abortive, so as to produce a me-sceded frait. 'Thats the threexelled ovary of the vale and of the hated, with two orules in each ecll, becomes, by the nondevelopment of two cells and five oviles, a fruit wilh oue seed ; and the two-eclled ovary of the ash, aud the there-callal aviury of the cocom-mat, likewise problure one-cellerl ant vae-serded fraits. Sometimes also false dissepinents we fommed, which prodiace in the frnit a ereater mumber of cells than rxistal in the wary. Jhowe encoally, however, the fruit aseres with the ovary in the manher of its rolls and serels. liut mot unfrequently, the strueturo of the forit is menderol comparatively diflient
 mather on fulp, sometimes in wee jat and sometimes in :wother:

## FRUTT.

All that is extemal to the proper intequments of the seed in the ripe fruit is called the perirump (Gr. peri, around; and kurpos, fruit); and this, which varies extromely in size and other characters, usually consists uf three layers, the ontermust of which is callel the 'pirarp (ivr. equi, upm); the midde ane. the mesocury ( ir . mesos, millle), on sometimes the surcocorp (Gir. surir. flesh) ; and the innermost, the embucerp' (Gr. emen, within). These parts exhinit great variety, but it in yenerally the mesweare which bremocs succulent or theshys as in the puach, cherry, 1 hm , and other drupes; and in the pear, apph, ani other pomes. In dhupes, or stone froits, the imblonarp, is the hard shell which immediately covers the seed;

Drupe (section of a Peach).
in pomes, it is the scaly lining of the seed-hearing cavities in the centre: in hoth irnges aml funmes, the epicarp is the onter skim. So in ruchome, enenmbers, and gourls, the sucenlont part is the mesmarp, greatly developed, with it thin equearp aml a thimere endocarp. In the mange, however, and all of that family, the epicary, amt mesocarp tosether fom the rind, whilst the pulpy cells belone to the endowarp. In berries, as the fonscherry, graps. \&c.. the pulpy matter deres not lowng to any of the layers of the periearp, lut is formed from the placentas of the seruls.

Whan the fruit, as the fully developed ovarre is considered as a modifiol lan or leares, the equicarp is viewed as representing the epilomais of the lower surface, the endowarp the pidernis of the mper surface, and the mesocary the substance (perronchyma) of the leat. The mitrib of the laf is traced is the dorwal weine of the froit or of each companent carpl, and the eroutral sumpe is formed hy its folling topether and the comjunction of its enlyes. The dorsal and ventral sutures are very uhmins in the penle of pease boans. de. ; and eron in fruits formed of serval earpls intimately combinal, they often becone vory apment when the ripend fruit opens to allow the escapto of the sects. The ormines or dhescense (Lat. Ithiser, to open) of fruits takes place in various ways; thus, the fruit sometimes resolves itself into its oricinal carpels be separation thrmgh the disus gimentor, which divide into two phates forming the sides of the valves, and the earpels further open hy their sutures: the pericarp sometimes splits at once ly domen sutures of the carpels; sometimes it diviles transursely, and throws off a lil: sometimes it perns more partially by prese, \&e. Many fruits, however, are indchiscent, some of which are innits having a besy hare pericarp, as mats, amb some are fruits having a soft pericarp and moch pulp. The decay of the pericarp is in these cases necessary to the libneration of the seetis, unless when this is accomplished by such means as the fruit hecoming the food of ammals, by whicla also the seeds of plants are often widely distributed. The decay of the pericarp seems intended, in many cases, to poride the first nourishment for the young phants which suring from the seeds.

A classitication of the different kiods of iruits is extremely dithenlt, althongh thay athirl characters of great imputance in leseriptive amel systematio lotalay. A momenient primary division of fruits is intu thase whith are formed from one flower, and those which are formonl by inconpration of the ovaries of mavy tlowers. Fruits formal from ons. lhwor, ly far the most muncrons of thane twa classes, are divided intor apurarymen amd symentouns,

 vither dry or succulent, dehisemt ur imbhian ant.
 tions included amone the afociarpons. are formend if s.veral or many free carpels: sometimes iry, somb. times shectent; sometimes arranged on a convex or werated receptacle: which leecrmats sumenhent in the strawherry, and constitutes the enlifle part of the
 ly the cularsel tube of the mbx, ats in the mose. Sbicarpuns fruits are formed if sereral carpels. intimately united in their mature state, so its th
 fruits smetimes so complety rablve themetres into their orginal eariels, that these maty be restuded as hecoming suparate achemia. Fruits furmet hy incorpuration of the waries of many thwers (collective or antlogerpuas finito) are sema' times liry, as the cones of tite: sumetimes sucen. lent, as the pine-aple the mull rrys and the lis. fire further nutice of difierent limels of fruits, we must refer to particular artiefos in which they are leseribel, as anhemium, homy, apsule, hrupe, mut,
 shen yrmine them.
A fow plants, particularly the Conifine and Crowlertar. proluce sects rally naked or destitute of pericary. Many wther seels were formurly often describen ns makel. in which the pericarp" exists intimately incurpraterl with the seed, ats the seeds if grasses, Leraymet, Lethotir, Combllifere, \&e. Their real natare is often made angarent ly some trace of the style.
The probuctun of ripe fruit is exhanstive to the chergies of a plant, aml plants ordinarily ammand may he preservel in hif for suratal yers hey pro venting it. Very fome frait-trees encrally fal to lorims fruit to pritectiont, and the first flowers of melous ant empres ate ufen, for at similar reasun, alortive; whilst, on the contrary any circumstance that farmurs an acommatime of say in at particular seasm, temis to rember fruit-trees masually frombetive in the moxt, as when the whule hhesmen of a year are killed by frost, or whon, from the collumss of
 formed in almmance. Whilat the vital energits of a ${ }^{\text {blant are }}$ directel manly bwarls the increase of its size, dhater-buls are sparimely fomed or thot at all, as is niten the case with fruit-trets mowing very luxuriantly, and rarions moles ate athpted to cansi* the prothetion of Hower-inde and of fruit loy cheek. ing this luxurinace of erowth, ins by rout-pmans. by cutting into the stem of wall-trecs to a muderate depth, wh hy taking ofle purtions if the bark of the stem. Dratime (I. W.) is alon of use in this resuret, as well as for the propasanom improvel vareties of fruit-trees, the qualitics of which wombl, in all probahility, not he frand exactly the same in their offering by sces.

In a very inmature statio fruits are in gencral ETecn and soft, and elecompose carlmone aciul mas in the sunlight, alsurtine the carlom, and setting free the oxygen, like leaves and other green parts of plants. As they advance towarls maturity, some of them become caternally dry and hard, and cease to $\mathrm{l}^{\text {erform }}$ by their surface these functions of
regetation: whers, as they beonm more sucenlent,

FRUIT-GALOEX. Som kinds of fruits have fran enltivated from the emplest historice ates. Th say mothing of the garlen of Llen, and the vineyard which Noah phantul after the Deluge, we find in the law ks of Dhese widmer that the cultivation of fraits was much partisel in beyt before the time of the exombe of the lemadites: ind amongst the
 inhalhitants of ladia, it com in like manare le traced lack to the most womate antiquity. The Greeks and homans probally derivel their kawhedge of the art, as well as many of their timest varicties of fruit-tres. from the Fast : 'hammane reguired attention to be pail to it thronghout his wide dominions, and contrimutel murls to its extension in regions of limpo previonsly too rule for its prevalence: and during the miblle ages it was most sucetssfully prosicuted by the monks in the garilens of the ministeries.

The grale. the fig, the melon, and the pomegramate, are ameme the first fruits of which we lime any partienlar mofice in history. The cultivation of the apple, the pear, and some ithers, is also muluestiomally of very grat antiquity. Interesting particulars concoming the anost impertant kimels of fruit, will is fond muler the resertive hands.

The cultivation of fruits is generally carried on in eonometion with that of enlinary veretahles, flowers, and cother cobjects of the gartemer's eare; and the: fruit-garden is ahost necossarily more or lass combinel with the litelen-garhen, de. The term fruit-garden is temerally used when the gromme betwen fruit-trees is reqularly tillenl and made to proulnce ather surinn erops ; the term Oreharil (q. $\%$ ), when it is hain down in prass, or enltivated for erain ame nther agricultural rops. The latter methom is practicalle only with some, and these the more hardy kimels of fruit-trees.

Fruit-trees, in the onen air, are cultivated either as wall-trees, espalier-trees, or stambards. The walls intended for fruit-trees are cither of brick or stone, the former, however, being preferatle, and are gemerally from ton to fourteen feet high. Wialls serve mit only fur protection from winds, hat for the radiation of lueit, and thus comenterance in part the disudwatues of coh elimates. The tranins of wall-trees will he noticed in in seprate article. Se Wabl-tiers. Dapaliers (q. w.) serve in an inferior deqree the purpises of walls. Walls are sometimes thaed ind artificially heated, by which means carly ripenins is securel, and varieties of froit ar prolnced whinh could mot wherwise in the same locality be erown in the "pen air. The production of fruits bumerime to warm climates is also effected in the colder parts of the world by means of Jothanses (1. $r$.), in which the trees are geacrally tramed dither as wall-trees or on frames stretehed almost herizantally, luth methouls being commomly alopted in the same hothousce Standard trees, which reveve no other traming than mere proning, If the oceasional tying of a principal branch, to gnide it in a particular direction, are further

 is the result of deticiency of air, as in exmonstion of

 intensity and mamate hass of heat in application, as in the case of cartmo.

'lhese sulustances must her themselves heated before they can bum. Hybrneen legins to himen at ar lemon athe, while "arion requires a red hat (son) to 1000 F. and even at that temperature homs wery slowly: Consentuently. where they are combinct, as in common coal, the temprature prosent is uften sumbintly high to iunite and comsme the hydrugen, white the carbin remains unchanged as cinder, or passes away as smoke, mennsumed in cither case.

All that has been said almoe, of carbom, as to air renuiren, hating fower or valite, atmost tonbrature, tumprature of iznition. effect of water prosent, and of exess or deffereney of air. aplines, without montification, to one class uf furls the purcly carhmacens, indudins anthracite, coke tram enal, chaveorl frow wowl and leat, and the cinder of amy aseription of fucl. The incomlimstilile ass most be alloweal for in waleulatin! heating lower ar value: and also the volatile lumbe-nitrusen. sulphur. \&e-the latter of which irepurntly rembers the fuel mosuitalle for many burpuses in the arts and mamfactures.
leat. wowl. and emal, with the exception of anthracite, comtain hylrogen to an extent rarely "xamenges fee cent. We have sem that, comb pared with "arbon, hyirnow repuires three times as much air, ame marates benty fome thes as moch
 hat, amb ignites at a much lower tomperature; wht the cmandion of woon, coal, fee, is in these repperts molified accorling to the proption of hydrogen present in them.
 Eritish coul, as deternimed loy lhayair and be la the process of combustion.

When coal is heated in a retort, it yields whatilo
 of its weight (soe colmon 1) Tha hydraten hass robleng the fuel if six times its awi weight uf carbm. When fresh furl is added to live coal in

The clenents uf a hyatrocatom are eonsumen, not simaltanemaly: but in sucension. First, the wathon is separated from the hydregen in light flonting particles, sulosedumently sen as soot or smake (if not comsumen) ; then the hyirogen hurns, and commmieates lusat to the carlon particles,
 Hime inlicates the temperatme perenen ; and if the timpreature i.s sufficiently hich, the eartron of Which the thame is compused lamps alsu, frolucing a further incrose of latat. If mot, the flame, as it moves nowatal, comb, leveming red, dall red, and tinally black amb smoke, passing away es such. For complate commastion of comman coal, we therafore require mot only air in sulfiment quatity, lut alsu intorsity of heat alowe the fillol. Wre rergine a low tomarature to separate the embm from the hydroyen; in higher temperature to comatme the hydrogen: amb a still hisher to consumb the carbon of the thime. In mosel furnaces, surfla as there of steanlailera, whild the curtent of nir supplied ematinus potty mifom in 'raintity, the wolatile landies arw
 wand require, for the monent, pertaps tour times the quantity of air which is pascing throush. The volatile funt is, in eorssenfance of the want of air. carrod off jatly meonsmacel: and the tomperature in such funaces is fremently too low for the ignition of carhom, in may lee sont fron the comm of the flame; the enk buike having ahstracted the heat lefore the tlame has boen suljecterl to its intluence. We refor to the article smoke 'ossumpros of for an aceomet of the plans which have heen adopent to secme perfect combustion, and thus prewat somok. From the principles invelverl, we shomld expect most suceess where the fuel is supplical hy mechanical arranmenents as remplarly and mifiomly as the air, and where, in audition, the boly of the furmace is protected or remowed so far from loiler-suface and othor cooling arents as is necessary th maintain a temperature within it sufficient for the thornogh ignition of the thame. In hense-fires, where the luat is last if not radiaterl forward into the rom, the cinders shomk le ilrawn to the front, aum the fresh fuel laid into the vacant space lehind. The gases rise between the two, and being lighly heateil, form a shect of 191
flime alowe and lochme the real- lat fucl in front. 1f, as is commonly hone, we thon the fresh fuel on tha tap of the lise coal, we intrmut the prowess of rimiatiom. and the gisorns part of the fued is thrown ntl rapmaly int the come atmosiluere alowe the grate.
 has clapsed. 'J'u sur monary tire utensils, we minht with alvantane ath me of it rake shatse, suited for drawing forwarel the fued.

Fom dimunions of furnaces, \&e., sec SteamExicis.
Lendumy of fuel will be thest secured, first, hy accomphishing enerfect combustion looth of tho tixel aml valatile parts of the fuel ; and semomy, by regulating the amont of air, as any excess of this has to lee jassied on to the chimmey at the same high temprature as the true prolucts of combustion.

The alnumbure ur seareity of fued has a great effect on the weneral interests of a comentry and the comfort of its inhalhitants. The wealth aml prosperity of liritain mast he attributed in mus small degree to the abumlance of comal in those districts looth of Euglaml ambl Sentland in which ironstons is most almulint, and in which, therefore, the coml is repuired as thel for smelting it. But ven for the mant mimary uses of domestic enmmuy, the seareity of fuel in some pats of the worlu callses much hariship to their inhalnitumts, whilst its ahomane in others is one of their ereatest matural alvantases. 'oal, wool, and peat are the there kimis of fund pincipally used; coal being indeed the wergation of former ares- or rather of former acoloctical forimb- the proluct of their smanhe and their shawers, treasmed mp for tha pesent ; 1"at, a recent fimmation. Conal may lue samel in Nenmal to be of ahout twice the value of woul as full, wight fon whisht, in its heating lwwer. In thour fints of the word in which coal is not fomme, an to which it camot he masily-ur as yet protitahly - cmarega, the pescration of forester is of great importance: smitrecs are not mirequently planten, as in sume parts of Limple, in ledgerows and otherwise, ehictly in order to provite a supply of fuel. fon the same reasun, fullarding is resortert to, the hranches heing hemb as fael, and the trank left to produce new iranches. Only some kinds of trees are adapheal to this monde of treatment. In some revinns, as on some of the stepues of $I \sin$ and other treeless plains, the dried dumes of herbivarons animals is much used as fuel. In cases of less extreme necessity; all limels of vegetable refuse are used. 'Thus, in miny jarts of the continent of Eurone, things are carctally gathered un for fuel which in any gurt of Britain would most probably fre burned on the died, to get them ont of the way. But it is not casy to compute the benefit elerival ly many larts ciren of Britain, particularly the
inlanel parts，from the recent great increase of the iacilitios of eornmaniation aml of the trade in cual．

his chlest son, Andrew F', mate such sempl nse of his share of the inheritance that be ant the mane If 'the Tich Fugser.' by mariane. he fommond a mohe hine, which, however, diat out in Lisio. Joha's semad san, Tacol, F., who dioh in 1.469, was surerin and 'twelver' of the weaver-mild, and aman held in high wistem loy his fellow-citizens: he was the first of the Fuggers that hath a herase in Ausshares, and he alreally carried on the cxtonsive commerec.

Of his seven sons, there, lohich, liomere and Jacol. 11., by meaus of industry, ahblity, and intersrity, extculed their hasiness to an extrabomary degree, and lath the fombation for the palmy days of the fanily. They marrine inter the noldest honses, and were raised by the lompern Naximilian to the rank of nobles. The emperor montraged to them, for 70,0 or quhl whlens, the comety of Kirchlerg aud the lordship of Wciswenhnm, aud received frob them afterwards, through the modiation of Popre Julins II., 1 go, (000 incats, to assist in carryiug on the war against Toniet. Clrich F., lom it41, dict lind, hevoted himself specially the themmerce that he "penel up with Austria, and there was almost no abject that dil mot anter into his speculations: even the master-pinees of Alinert Direr went through his hands to ltaly: Jacol, F., horn 145!. dicel 1525, encaged in mining: he farmed the mines in Turol, ant accumatan immense wealth ; he lent to the Arcluduke of Austria lin,owo suldens, and built the mannificent castle of Fugerim, in Tyrol. Thus the wealth of the Fugqers weut on increasing. Their wares went to all lands, amb scarce a road ur sea lut bure their wagne or ships.
lont it was unde ' 'harles 1 . that the fonse attained its wreatest splembur. dacolb having dien chiluess, and the family of Tlrich being also coxtinct, the fortures and splambur of the honse rested on the srons of Cimere F ., who died in 1 nollo. At has death, he luft three sons, whe of whom, Warcus, , atered the church; the two founcer, Fammad and Antony, carried on the lusiness, and lecame the foumers of the tho chief and still flomishing lines of the House of F"ugere. The two Inothers were zealons (iatholien, and with therr wealth supmorted Eek in his opmosition to Lather. Whrime the diet hehl ly ('harles Y. at Augsurg. in bow, the emperor liven in Antony Fi's spleudid house: in the Wine Market. On this occasion, be raised both lrothers to the rank of counts, and invested them with the still mortgaged propraties of Kirchbers and Weissenhorn; and a letter noder the imperial seal conferred on them the rights of urinces. For the support they afforded him in his expedition against Algiers in 1535, they received
the right if conimer mone Antory fi, at his death, loft six millinns sold cronns in ready moncy, besibles jowchs and possicssions in all parts of linope and in beth limkios. It is of him that the Eruperor ('harles is satil to have romarkel while being shewn the reyal trasmy in ل'aris: "There is a linem-weaver in An shoury that coukd joy all that out of his cwn 14ense.'

The Fompror Fertinamb 4 . rasel the splembour of the Monse of F . still hioner while comoming the imperial lettor of ('larles, in ecoherring great anditiond privilues on the tho ullest of the family, lomats dohn and Jorome. The Fineters continncal still ad mobles to cary on the ir commore, and furthre ancrasel their immonse walth. They attained tha lrishest lusts in the cmpric, and seval princely homses primed themselves an their atliance with tha llonsu of Fuger. Ther fossessed the most catemsive hararips and eollectimis of objects of art, mantained painters and mosicma, and likerally encourased irt and soience. Thoir homsers and candens were master-pietes of the armitecture and taste wi the timos. There is thas nothing incrertible in the story that Antony $F$., wn wne urasion when Charles 1. was his visitor, lightell a dime of cimabum wom with the conperors hand for money bent him.

While thas imblager in splembur, they wore not less bunt an doing gom?. Uhrich, (iemse, and Jacolb, the sons of the hencticent Jacol, Dunght honses in Gne uf the submbs of Augsbury, pallect them down, and huilt los smaller homses, whel they let to pand citizuns at a luw rent. This was the irimin of the 'Fagscrei.' which still remains mone the same nanke, with its cwa walls and dates. Many whar benewhent institutions were set on funt ly intony F. and his sons. It is questionalile if we are to rank anones their bencfactions their calling tho Tesuits to Augbores and giving thom buidenges and revenmes fur a college, chmeh, amb sehonl. 'The ratee is still continuct in the two principal lints of Rammarl and Antony, besides collateral branches. The domains are chicily in Bavaria. I comection of portrats of the most inmertant mombers of this great house, execonted Dy Domin. Costors of AntWerp, allyared at Ansthurs ( 1503 (et serf). This collection (increased tor 127. with eenealories written in Latin) was repullisheni by the brothers Kilian (Ansshury l615): and in 17.in, a new chition of the work, still further improwed, and containing l:39 protraits, was pmblished at Clm, meler the title

MTIITATLON: A sentence of fugitation in Sootlad enrrespmats to nutlawry in a criminal process in Englaut, and is promounced where a person fails to appear to answer to a criminal prosecution against him. Amongst other consequeuees, it entails the escheat of his whole movable property to the counn. See Eseneit.

WUGITIVE SLAVE LAW゙, Haves being recarded as preperty, things and not persons, as the loman law puts it, tho existeuce in every state in which slavery exists of a law recognising the right of the master to rectam his property follows as a logical consexpence. Aceortingly, the constitution of the Unital states of America having reconnised shavery, or' 'scruice,' as it is athty termed by American witers, necestarily coutained a number of cnactmonts for its enforcement. liy art. 4 , s. 2 of that dencument, it is declared that fersous hedel to service or lathar in one state, umder the laws thereof, and eseaping into another, shall be delivered up, on claim of the party to whom such service or hahour may he due. In furtherance of this provision, the laws of New York have provided for the arrest of

 of the suly ram "hats of to rrituriss and ly such
 aflon int. It is flow buty of all l'nitoll states

 With the arrut if :ny fasitives, surh nffiers are
 Whan any fuention has deaped into amblur state or

 mag in mand it warmat and arest frem the whace havins in antlanity. The fugitive is then to loe
 is to herar and haternine the comphaint in :s sime mary maner. Shand he ine satisfied of the validity of the chaim amb the ihentity of the slave, it is his daty thd diver to the damant a certificate of the praculing lad, with autherity to remore the fugitive to the phate from which he thel. Tha testimeny of the fugitive is met admissilde. Any assistame rendered to a iwitive to cmaht him the saque irnu the clamant, "ir any whstrnction (ffeerel to lis arront. is prmal, and also suligects tha darty th damase at the suit of the awner. All citizens of the I niten states are retpuivel, whan called innon, thinale the officers: fersmal assistance in tha" fertomane of thar duties. These provisions aply to all the states, or dided so, at least, previunsly the the war, whe ther shavery was rengnisch by the ir special laws on mot: the principle leang that the constithfion and laws of the [nitul States secher the right the redam furitive slaves against state le gislation? bamen of the shas hambins states, it is Fich, that if a slate from such as atate gen law fully intu in mon-
 with his mastor. of is emaripatel there lay his
 slaw on his return; lat it he le carried there for at
tompmary furnmen and return, his state of slavery is manel. Thase pravisions have m, buthure on the comblitun of the fugitive slave (kent, ut sng. ii. 5 , 10 .

IM (:1,EMAN: (properly, Fhumimen, from the
 in tront if a limen men at drill, th give the time anid the cxample of the nortions in the manual and Mitum excreses. He "riginally stond in frumt of the rinht wing, amblence the mame.
FT'til t , in Macic, is the name of a compoxition wherein the farts lin mit all hegin at inver, but follhen or jursue vie another at ortain distances; theore the name, F'ug, it flight of chase, each part snccessively taking up the suljeect or modoly. Any of the parts may begin the fume, hat the others follow acemerting to fixed rules. The suliject is senerally a fow hars of meloly, which is given out in the principal kes lys the pait which begins. The meat bart whinh inters repuats the same moldoly, but al lifth hiogher or at fourth lower, and is called the answer. The third fart follows with the sul ject again in the pincipal key, hat an wetave ligher or lower than the first part, and is answered ly the fourth part in the same mamer as the scoond part answers the irst. After the suliject is completen, the meloly which follows it, so as to form a contimuation of the part, is callerl the connterpoint. in the construction of which, facilities for ingenims domble commerpoints of varions kinds are afforled. Whon the sulject and answer have been introduceld in all the parts, the first scetion of the fugue is said to loe complated: an intermediate harmeny of a few lares then fullows, sometimes in its form like part of the sulpicect, and with at modulation intor a nearly relatell key. The sulfiect and answer are arain houcht forward, mat following in a different order from the first seetion: while at the same time all the parts are continued, and in some of them the ominal muntephint appears either simply or inverted, the sulject amd answer forming the predominatine ilea throughent the whole composition, and towarls the emd apmearing in a variety of forms, intorvals, ann monlitications. When the sulject dons not exteml in emmpass loyom? the half of an netave, the answer is invarially made in the other half; amd th avoil modulatimi ont of the kes, the prugression of a tifth is amswereal hy a funth. A flug consisting of one subject with a counterpmint throundont, is called a strict fugne as in the follow. ime campld ly J. Solmastian Bach, in which the lirst prugerssion of a fifth is answered by a fourth:

 bs

FLLAS [properly, Futhe (sing. Pello), callm also Féllani (sing. Bafellanchi), Fellita, and Fullan], the name of a widely spread negro peome in "pher simkin, regardius whose origin there is much

 has enteavoured to comeet them with the Makeys in the far East, but, according to Dr Barth, 'mome of his artuments are of any cmsequence.' lit $\mathrm{Hr}_{\mathrm{r}}$ barth himsile is of opinion that their origin is to le somutht for in the direction of the East: But this,' how alds, 'refers to an age which for us is cnvelomed in impenctralbe darkness.' The F . hirst comerge into the hight if history about the begimmin: of the $14 t h$ C., when, as we learn from Ahmed Babits Misten! ! Sídien, two mombers of the tribe went on a rell. gions mission irum Molle, on the loriors of Semegambia. to the king of Bormo. The impatance of this incident lies in the fact, that it shews that in the dawn of their history-as has invariably been the ease in later times-the comerse of the tribe was from mest to fast. and also, that at the varly perionl reforred to they were ilistmgushal for that religious leaming which still characterises them. After the 14 th $c$., successive swams of Farpar ta have laft the kincalua of Malle, or the monntainons remion of Fuhdu, ant to have spreai themselves wro the greater purtion of suring. "ahsurbing and inenmorating with themsulyes Nifherent and guite listinet matimal elements, which have given to their community a rather varyiur and muldedide charater.' llane omighate thr "om Hheting acomuts of travellers, some of whom spati of the le: as differing little from the wowes: others, as havine their fuatures and skulls cast in the Europan monhl; while Bowen duseribes thase of Coruba as hoing some hlark, some almost white. sum may of a mulato, colour, varyiug from dark tovery bright. Many other trinne which have not been quite alosurbed liy the F , are yot so far blendel with them, that they have lost their mative
ibion alterether, and speals the lanmage of the premminant race, which is termed the Fulfilde. The F . are not all nuler one pater: they are at reter, 3n, it nation: and have fumbled many lingeloms, nnels as thase of Köknon, Cando, Timlo, \&e. The -ubll, ss tribes belonging to thoir stock are gemerally elivided into fimer eromers or familios, the Jol, the b;ai, the sion and tlu lorit. Nust of them lecame comered to Mohnamomanism alont the midele of the lsth e.. and in late, nuler the Infim Otham, conmmeen a relgions war on the surromming puans, which terminated posperonsly in the estab. lishment of the groat Fulah "mupire of Sulato. Whman diol in at surt of fomatieal ecestasy or mathens in 1518 . The F , are induatrinas and inclinct to trade: they work irom and silver, mame facture with great neatness :rrticles in wood and leather, and weave sarims damble fabrics. They are liy far the most intelligent of the inhabitants of stiling, ame have, besides mosques, sehoods in almust all their towns.

FU'LCRUM, in Mechanies, is the prop or fixed proint on which a lever moves. Sice Leviai.

FULDA, a town of Fermany, in the clectorate of Hesse-c'assel, 54 miles south of Cassel, is pleasintly situateal (1n a rising-gromm on the right hank of the Fuhda, a consideralble strean, which, rising from the western hase of the Ihüngehirge, in Bavaria, Hows northwart through Hesse-Cassel, and unites with the Werra on the Inaverian border, after a course of 110 miles. It is a pretty town, surroundeal by ohi walls, amil has a market-phace, two symares and eight sularls. One of the chici louldings is the cathedral, the fourth churel that has lecen huilt on this site. It is a handsome modern structure and eovers the shriae in which the body of st Bonifacius was darosited after his murder lay the Frisians in rist. The wher notable structures are the paize formorly the residence of the prince-bishops of $F$ : the chureh of it Michach, fommed in soz; a gemmasim, schools of art amd manfactures, and a pibhic litrary. F. has acquired arputation for its linen manufactures; it has alsu extensive estahlishments for the manufacture of rinegar and lecr; with lye-works, tameries, and weating. Popy 14, noo, mostly Poman Catholies. The proviace of Fulda, of which $F$. is the eapital, forms bat of what was formerly the grameduchy of Fuha. This territory was incorpurated with the grami-duchy of Frankfurt ly Napoleon in 1810, and cederl to Prussia in 1sib, but immediately afterwarts was mate over to Hesse-Cassel.

## FU'LGORA, Sce Lavtern-firs.

FU'LGURITES (Lat., follow, lightning), tubes formed of vitrified sad, which are fomme in samdlanks, amb in soils consistime chiefly of silicions samb, and are attributod to the action of lightming melting and vitrifying the sant. The were tirst diseovered in 7 IIl ly the pastor Herman, at Dlassel, in Nilesia mon have since been fonod in many places; lut thoir origin was first T"ninted wat liy Dr Hentzen in 180.5. They are firmn a quarter of an inch to two inches and is half in diameter, their internal surface of a perfectly glassy sulastance, hard enourh to serateh glase, and to give fire with stect. They are nomally, but wot always, placel vertically in the samd, beome naroner downwards. and sometimes divide and subdivide into lranches.-The checes of lightning sem to be exhibited also in some places on rocks hy vitribation amd the prembetion of a sort of chamel, sometimes assuming the form of beads.
leULHAN, formerly a village, but now a suburb, of London, in the south of Madilesex, on the left
bank of the Thames, six miles south-west of St Paul's.

## FU'LICA. Sce Coot.

FULIGULA. See Pocirarid.
TULLAR, AxDREw, an emincut Saptist minister, and theological amd controversial writer, the son of a small famer, was born at Wichon, Cambindeshire, Pehruary ( 6,1754 . He recenvel the ruliments of his celucation at the free schom of soham, aml in his youth was principally engaged in agricultural labours. In his 17 th yoar, he heenme a member of a Baptist church at Soham, and in 17.5 he was chosen pastor of a congregation at that phace. His small stipent of tel per ammom he emhaveneel to increase by kecpinc, first a small shop, and then a school. In 17 s 2 , he removed to Kuttering, Nurthamponshire, to take the pastorato of a congragation there. On the formation, in 170 , of the lompist Missimary Society ly Dr C'ares himself, and devan other ministers, he was apmintol its secretary, and the whole of his future life was dewned to tha administration of its affairs. In 1794 he phlalished a controversial treatise, entitled 'The relcimintic: and Sorinmen signtems, axtemined ame comperoel nis the their Moral Trwiney (Lomd, swo). This work was attacked by Dr Toulmin and Mr Kuntish, an! 1 '。 replied in a pamplet, entithed Socinimism / mblif.
 tions are The (forpel itaome IViturss (Clipistone, 1797). and Eispository Diseourse on the Book of Ginemin (2role 8 so, (conl. 1s06). He was also the anthom of a viriety of single sermous and paminlets. The sense, sazuity, and thomohly practical knowledme of mankind which these writings display, have won for l' the title of 'the Frakian of Theoleng.' He died May 7.1815. Thwee collectal alitions of his works have been pmblished, hesides American reprints: the tirst in 10 whls. Svo, the secmel in 5 , and the thind in 1 royal Sro. A volume "f his treatises was republished in Bohn's Stanlard Library, with a Memoir ly his som. F's Mimai of the lifo. Simmel Parce of Birminglame is much esteemed as a religious biography.

FleLleR, Sirait Maraneet, Marmhoness Oscoli, an American lady, whose talents, rawe indiviluality of character, and untimely death, give to her histury ar fenliar and tragic interest, was bum at Cambridgeport, in Massachusetts, in 1810 . Tndel the care of her father, a lawer and nember of Congress, she was carly and thoroughly instructed in the elassics. It is relatel that he used to say of her, while still a chilh, that she 'knew more Litin and rivek than half the professors.' At a wery early atge, she had also made ereat proficiency in French am Italian. After the death of her father in 1435, she became teachor of languages in Boston, and sulsequently principal of a school at l'rovidence, Lhode Island. In 1839, she pubbished a transJation of Eckernann's ('unmersations with Gothe. she became, in 1540, cultor of the Ihal, a periodical instituted for the adrocacy and diffusion of Transcemdentalism in America, and for which she wrote a mumber of adnirable articles m literature and art. Her criligue on Grethe expecially, in the second rulume of the Dicl, has been greatly and desarevedy: praised. "Nuwhere, says Mr Encerson, "did Goethe tind a hraver, more intelligent, or more sympathetic reaker, ller summor on the Lakes, a vivil and truthful picture of prairie-life, was published in 184.3. Soon after, slie took eharge of the literary department of the Frow Fork Trilune. In 1846, she visited England, where she made the acruaintance of Carlyle and other cminent men. lirom London, she journeyed through France to 1taly. At Lome, she accidentally became acquaintcd with
the Marpuis Ossoli, to whom, though many years $^{\text {a }}$ bounger than herself, she was marrical in fecember 154\%. She ruk the deeplest interest in the cause of 1talian liberty: and huring the siege of Liome, in 1549, thwoted horself with untiring assiduity to the care of the sick and wombel. In May that. she and hor hashand ant sail for Amorica; but a vielent stum having arisen when they worn bear the const of the luital statos, the vessel struck on J'ire 1sland beach, Lung Islamet, in the momine of the loth of faly, and a few homes after went to pinces. Among thene whan perished
 chidd.

JULLLER: Timase, D.D., an aminent Enelish listorian and divinc, was burn in I604 at Aldwinkl. Northamponshire, of which parish his father was rector. 13e was macated at Quechas tonloge, ('amhaviere, and gratly distimanshed himself by lis
 in 1624 , and that if A.M1. in 162 . 140 . atome so hiof in the "stimation of his collowe that. bufore he

 preacher. Aun after, he was collated tor apewome in Salishory 'ath dral, and whaned a followshige

 11. was next pesonted th the roctory of harad

 remaned to lomdm, where he was clusen lecture at the Savey (hurch in the Stramd. The samm year, be was a mombur of the Cinvonation at Westminster, and whe of the select momittw apponted to draw ap new canms for the luttor fovernment of the chumch. During the civil war he authered firmly to the royal canse; am sharm in its reversts. In lfitb, however, har was chosen lecturer, first, at it Clmment : Lan', Lombarl Street,
 prsented to the Iiving of Walthm, in Essex. In 16.0, be puldisheal a georraphical account of tha Holy Lame, entitled I Pisphts sight of Pabatine

 The Eluw h Historlt of Livituin, Jimm the Birth of thens Chrint until the yrat libis (filio). In 16.:s, he received the living of ('ranford. Niddesox, and at the Restoration he was reinstated in his prehnet of Salishory, uf which he had been deprived ly the Jarliamentarians. He was als" apminted chapdan extraordinary to the kinne amb "reated 1.1. at cambinge by royal mamamus. He died August 16, 16ibl. Mis principal work. The IVorthios af Fimgland, was dublishal at Londom in 1602 (folio). Valuahke for the information it contains on provincial history, it alammls in biorrahlacal anecdote, witty remark, and achte abservation on nuen and manners. A new palition, with his life juefixed, appearet in 1810 ( $\because:$ vols. 4to). His Moly and Projune States were republished in America in 183i. Quaint humour is one of F :s peculiar characteristics: but his writings are no less ronarkable for wisdom, imanination, and, when occasion demands, even fur pathus. "Next to Shaksurare,' says Coleringe, 'I am mot certain whether Thomas fuller, lueyoml all other writers, does not excite in me the sense and cmulation of the marvellons. . . . He was incomparably the most sensible, the least prejudiced great man, in an age that loasted of a galaxy of great men.'

FCHARLACEAE, a natural orler of exogmous phants; herbacculs, with a watery juice; their leaves alternate, much divided; the calyx of two deciduous sepals; the corolla of four very irrerular

Pethls: the stamens ennetims inne and fistinct. funto enmotlys sumb in the bundles: the wary

 as in thir hetaneal haracters approwhing mat
 ther astural aspuit is wery ditherent, and they the ant fusses the san ponertul propties. finh

 fannurite in sarilms and erombuses. Whe than Mue lumhrol spectes stre kmewn, wa tly natives of twaperate clinates in the mithern hemisplete. Soseral stecins of Fomarian and Corytalis are natives if britais. The Consos Frampory (Fumuries officimitio) is a very frefuent weed in

gariens and enrnticlds, but of rather delicate and hemetiful appearance, It is amual, and easy of extirnation, where it spmings in, in excessive abmaname. It was formerly much emphoyed in moclichu, havint a high repmention as a thaic and dindmetic, ani althum disused in britain, is still esteemed i: France as a renedy in sembutio atfections, chronic cruptions. \&c. Some of the wher Species of funitory pussess similar propertices. The leares lave an intensely bitter saline taste.

FHMATRIC ACHD, known alsu as Buletic Acha ( $2 \mathrm{HO} \mathrm{C}_{4}, \mathrm{H}_{2} \mathrm{O}_{0}$ ), is of frequent wemencen in the vegetahe kinghem. It was first obtaincl ly Bracomot from a species of lometus, and has since loen fmun in many other funci, in muncrous lichens, in varims species of Fumaria, in Corgdtlis bull wosa, \&c.

Fmanic achil may also be ohtainel, in association with malecic acil, liy heativg Malic Acill (1.v..) to $3: 5 \mathrm{~F}$.
It crystalises in misms, which have a very acid taste, are mhy slighty soluble in water, hut dis. solve readily in alcolued and ethers. At a temperature of $312 \underline{2} \mathrm{~F}$., it rolatilises without fusing. and is wnertel into the malcce acil alrealy mentiomed. which pussesses the same compersition as fumaric acish, hit differmt pronerties. If maleie acil is exparsel for al long tum" to a tumprature of $266^{\circ}$. it :cain passes into funaric acid, so that these acids are mutually convertible.
Kekulé lins recently shewn (Annalen d. Chemie, 1S6l) that both fumaric acill and malacic acid combine directly with bromine, and produce erystals of
dibwom-suceinic achl : aud further, that if fumaric and lac dissalual in water, and digested with an amilum of simbim. the nascent hyirogen from the inwommend water enmbines with the acid. and
 of monsecial interses.
 vame ingelinuts, which, hy their smouldering watu-tion, wedve atreabla entons. The following rempe for their enmusitinn is given in the Wirtembere Pharmangmia: Take of tenzonin and dry halam of Pru, each 16 parts: of gellow samdalwroni, at parts: of lablamm, I part: of charcoal iman line-tree would !at parts; of nitrate of potash, 2parts: and of muilare of traganath, chough to furns the mixture intu in misti, from which conical pastils are to be mand by at smath monald.

The 'Riblom of Brizes' is also cmployed for aromatio fmmigation in the same mamer as pastils. It is permach as follows: Dissulve two ounces of mitrate of petash in a pint of water; in this fluid, stech yond undressen entton-tape, and hang it up, to dry. Prepare a tincture compesed of spirit, half a fint: musk, half an onnce ; ritu uf roses, one drachn: lenzoin, inur funces: myrrh, halt an ounce ; orris. ront, hulf a proms. When this tincture has stmond for a montl, stec], the prepured tape in it. The tape when dried is lit for nse. Light it, blow out the thane: and as it smonhlurs, a fragrant rabour will rise into the air. Fur finther information on this and allied subjects, see Piesse's Ant of Pafumery.
FUMIGATIOX (Lat, fumigatio, from fitmus. snolen), the cleansing or medicating of the air of :n apartuncit ly means of vapours, cmployet chictly: for the purjuse of detaching infectivas poisons frim elothing, furniture, \&e sice contagos, Isfections. Ahst of the methols of fumigation formerly employed lave little real value, and are to be lioked on chictly as grateful to the senses: ala, fur instance, the hirmint of frankincense, camphers. \&e. The really active processes are noticed wubler the article Dininfectavis.
FENCHAL, the eapital amb the only town of
 sibe of the ishad, and comsists cliefly of one street, extending for about a mile along the shore, and of numernus strets amplanes at richt angles with the main strect, and loading up the hill which lacks the thwn. Its roulsteal is open, and its anchomase rocky anl meven. F. has a cathedral, numerons churches, and small convents, and is defended ly four furts. From it all the proluce of the island is exported.
FUNCTLONS, a mathematieal term. When two or mure rariables are combined with constants in an equation, and are such that a change of value of one implies a conresponding change of value of one or more of the others, then such variables are said to deprend on, and to lue functions of cach wher; and the expressimn of the mole of delenalcace is said to be a function of such variables. If such an expressin in involves mat one variable, it is said to be a function of one variable; if two are invelved, to tes a function of two variables: and so on. Thus $\sin x, e^{a x}$, log. $x, \sqrt{a^{2}-x^{2}}$ are functions of one variable-viz, of $x ; e^{a x+b y}$, Tan $(a x+b y) x^{2}$, are functions of two variables, $x$ and $y$; so $x y z, y^{2}+y^{2}+z^{2}$ are functions of three variables, aml sion. Functions are denoted by the symbols F,f. $\%$, \& C . Thus $\mathrm{F}(x)$ means a function of one variable, $x$, combinel with constants or not, as the case may be; $\psi(x y:)$ a function of three variables. These functional symbols are general, and their
speeifie fonns are the particular functions which arise from operations in algebra, trigonometry, de.

Functions are implicit on explicit. When one variable is expressed in terms of others, it is sain! to lee an explicit function of them; but when all the variables remain involvel in one expression, the function is san! to the implicit. Thus, $x^{2}+y^{2}-r^{2}$ $=0$ is an implicit function of two varibles, but $y=\sqrt{ } r^{2}-x^{2}$ is an explicit function of whe varialle. In explicit functions, the rariable which is exprossed in torms of the others is called the druutent variable, and the others the ind pondent varialles. Explicit functions are usually written in the form $z=f(x, y)$; implicit in the fum $u=V^{\prime}(x / m)=\%$ Functins, again, are algehraical or transemblental. Algchaical functions are those when involve the olerations of aldition, subtraction, \&e, and of involution and evolution. Transcendental functions are those where the operations symbolised :tre such as $e^{x}, \log _{e} \times x$, sin $x$, \&e.-i. e., exponential, lugarithmie, or circular. Functions, also, are simple or componind according as they involve one of several operations. $y=\sin x$ is a simple function; but $y=\log \cdot \sin x$ is compund. Further, functions are divided into the contiunons am the discontinnons, the circulating and the yerionie. Continuous functions are such as are subject to the fullowing conditions: 1 . As the varialle stadually changes. the function must gradually changu: : The $\overline{\mathrm{l}}$ : w symbolised liy the functional character must nut abruptly change. Cirenfating functions are those whose ralues lie within cortam limits for all walues of the variables. $y=\sin x$ is an cample at once of a continuous and of a cireulating function. A function is sail to be periodic when it takes the form $f^{\prime 2}(x)=x$ signifying that if nn $x$ the nereation $f$ be performal $n$ times, the resulting value will be $x$. Thus, $f(x)=\frac{1}{1-x}$ is a periodic function of the third order. For performing the operation indicated by $f$ the second time on $\frac{1}{1-x}$ as the varialle, we have

$$
f^{2}(x)=\frac{1}{1-\frac{1}{1-x}}=-\frac{1-x}{x} \text {; and the third time }
$$

$$
\text { we have } \left.f^{3}(x)=1-\frac{1}{1-x}\right)=x \text {. The fnnetional }
$$

calculus is a recent growth of the transcendmatal analysis. The olljuct of the Differential valculus ( $1 . \sim$. ) is gencrally to ascertain the changes in fumetions arising from the continuous and intinitusimal varation of their sulbect variables. The oliject of the new functional calculus is, speaking neacrally, to investigate the forms of functions and their growth, when they are subject tor a enntinnon: and intinitesimal chanoe as to form. Aceorliug to Mr Irie (treatise on the Infinitesimal Calculu*), as the differntial caleulus investigates 1 mperties of contimons numbers, so does the new calculus the properties of eontinuous functions ; and as there is an interral calculus of numbers, so there is an inverse calculus of functions. Of the new calculus, the C'aleulns of Variations (q. 3.) naty ie considered the main branch. It includes, of enurse, the subject of fuuctional equations. Functional equations are those in which it is reguired to determine from equations the forms of functions entering them: e. g., what is the funetion of $x$ and $y$ which satisties the equation $f(x) \times f(y)=f(x+y)$ ? See article Cabculus of Fiunctions in the Encyclopedia Metropolitanc.

FUND, FUNUING SYSTEM. Fund
(Lat. fumius, gronmu. foundation) means a surply of money or a sharce whence money may le obtained. When we speak of 'the funds' in this eountry, w. muon that creat organisation for loyzing amb selling the right to become a $\mathrm{p}^{\text {ahblic eveditor, and }}$ receive a share of the interost of the matimal methit. see 1nat, Sitmosil. When money has in this country been borrowed fur pmblic jminnows, and it hats leen fomme that it cambut low reand as a temo

 it; and hence we read from time to time that cortain whlyations ware converted from fluatiag into imuled debits.

HUNI, sinkivis, a pan pursmed for a comsilurahle prion for the pupose of collectime menoy for the dayment of the national delet of dirat Britain. It was begun in 1716 by Air liohert Walpole. (ertain taxes which had 1 wrinusly lwe latil on for limited ferions were then rembered in'rpetual, for the parpuse of paying the int rest of the funded delot. They ponducel more than enowh for this purpose, and the surphos was laid ande, that it might accmulate into a fomd for extingmishing the delt. It apmared to perate well, since, in $1-23$, after it hal axisted for twelve sears, delt was wiped ofl to the extent of $26,645,1$ on, It was mot ubservel that, during the wiping off. new d.ht had boen createl to about the same extent. so that the nation was just in the josition in which it would have bern had it neither hormwel nor repaid. It is suphosed that nir Fobert may lave secon the fallacy of the sinking fund, since in 1802 lue tomk halit a million from it to meet the expenditure of the war. instead of raising a new loan. It was in 1-bob, however. that the system was establishat on a great scale ly the younger Pitt, who. motwithstandine his ereat practical abilities, was entirely mitued In the theories of Dr Price in his work on Anmuitits. Thbe system continued to be comducted on an enormens scale until another stmbent of economy and figures conchasirely provel it to be neless. this was aceomplished in 1s1:3 by Dr Lamittom, in his Inquiry concerning the lise and Proyress, the
 of the Natimat Ithe of Grent Frituin. The fallacy which Lr llamilton shewel to $\mathrm{I}^{\text {wrade }}$ a sinkine fumb may be best explainal by a simple examble. suppose that one requires to bormw dion, and liys by tos a year as a fund to pay it up with. Accumulating at componm interest, this fund will fay back the donn in ahont tifteen years. The hurrower will, hewever. gain no more by the prevs than if he paid the es a yoar to his creditor, for his deld wond be diminishing to precistly the same extout as the fnol to pay it off wombld be increasing. suppose that while requirint only $\pm 100$, the borrower raises foor, and lents out one of them, accumblating the interest until the whole amounts to $\pm 000$; the bormwer will no doulth le receiving interest in $\pm 1(f)$, but he will le at the same time paying intocest on dent : aml he would repay his thit it the same cost and with more simplicity if, inst anl of lorrowing the second hombent at 5 Pr cent, he pail over es a year to his creditor. In these instances, nothine is lost loy the sinkins fund. l;ut suppose that in the last case the ereditor harl aurced to lend the $£ 100$ at 5 per cent, lout in eonsideration of the greater risk, would not lom the 200 at less than 6 per cent.. while the horrowrrean only get 5 per cent. for the hale which he relthda-bere the transaction wonll cause a dead lass of ad a year over the plan of repaying by instalments. This was exactly the ease with the Lritish sinking fund. The more money the ebancellor of the exehequer wanted, the ligher were the

Fi*RsTENW. $11.1 \%$ a small walled town of Prussia, in the province of Iramelenhurs, wn the riuht lank of the Surew, so miles east-south-east of locrlin. It has a lurbe churel of the luth e., the Marimkireh, which euntans a tine (ionthic Surra-
 sandstone, and lating from lislo. F. mommfactures linens and womthens, imi earries on some trade by river. I'ry is:

FÖTTII, a flomishing monufacturing town of Bavaria, in Midale Franconia, is situated at the conthence of the liednitz and the Pernitz, about is miles north-west of Nimberg, with which it is connected by a railway, lad ont in 1835. ant the first that was completer in Germany. It has numerus churches, symagomes, a town-hall, theatre, fic. It is the most industrious and most prosuemas manufacturins town of Bavaria; its mirrors, chandeliers, smuff-hoxes, lead-pencils, its hrass and wool wares, and its articles of dress, are famons. The making of motallic leaf, and the manufacture of articles in lirouze, are most important branches of industry. F. also produces pinchbeck ringe watch. keys, brass mails, spectacles anm ontical instrmments, in wreat abmbance. An anoual fair, lasting fourteen lays, takes place at Michac-Imas. Pobr. I7., 341 , of whom 2joo are Jews, anl the rent I'rotestants. F. first aplears in history about the leginning of the loth ce, when it belonget to the archbisbojes of liamberar. Subsequently it acknowledred the anthority of the Burgrafs of Nuremberg. In I03t, during the 'Thirty lears' War, the Austrian Croats louncal it to the gromm. In 1680 a great fire almust lain] it in ashes again. It first began to attain impmotance as a scat of mamufactures in the latter half of the last century.
 S., and longe from $\operatorname{son}^{\circ}$ to $86^{\circ} \mathrm{W} .$. separates Dlville Prninala un the sunth from Cocklimm Island on the morth, and conperts. Fox's Clammel on the east with the: Ginlf of lionthia un the west. It is of no value Whaterer as a means of communication, nor is ever likely to be so, its western entrance haviner been asccotained hy Captain Pary, who discovered it, on his secomb royage, to be inpenetrajbly closed from shome to share liy the aecummated iees of many fentri. It is traversel from west to cast by a strong currat, which leksses clown Fox's Chanuel intu Ilumenn's Ntrait.
rerZZL $\left(C / C_{0}\right)$, nenus of plants of the natural neler Lepummose, sub-order Papilionacer, distiowhished ly, a twor-duvd calyx with a small seale or brater on rach side at the lase, stamens all united h, their bilmments, amb a turgirl pon scarcely longer than the ralys. The Common F . ( $l^{+}$. Eaioomeres), alse cerleni Vmas amd Cionses, is a shrmb about two or throe foet linh, extremaly braneleal: the lamabns \&rem, strated, amd termmating in spines; tho lavis fow and lanevolate: the flowers numer011. shlituy ant yellow, 1 t is common in many 1i the sinthern parts of Furope and in Pritain, althenh it dues not reach any considerable elevation
on the British mountains, and often suffers from the feost of severe winters; whereas in mild seasons its flowers may be secn all winter, so that there is an oln proworb. . Love is ont of season when thu furza is out of hosson,' It is searecly known in any of the northern parts of lurope and limmens is sabl to lanve hurst into exclanations of mrateful rapture when le tirst saw a common covered with benshes ghwine in the profusinn of their rich molilen thowers. $l^{4}$. is sometine's planterl for lederes, bat is not wall snited for the purpose, rechbyine a great luakle of gromme whil not readily acyuiring sutficient strenerth; hesiles. it loes not, when eut, tem] to sequire a denser habit. It is nseful as affording wister from for sheepe and on this aceount is burued down to the ground liy sheepfarmers when its stems lecome ton high and woody, so that a suld $\mathrm{S}_{\mathrm{y}}$ of srem suculent shoots may be semurd. In sume parts of Wrales, $F$., chapped aud brused. forms the prineipal part of the winter fodeder of horses. In some platers. it is sown to yiedt green foom far sheep or other animals. but is prefecable to wther green erops anly on dey simely soils, where they could not be alvantageonsly cultivated. It is most extensive!y cultivated in Jlamers. It is elmphed and bruisw? loy means of a mallet, one ent of which is armet with knife-blates; or by nows of a simple machine, ralled a gorse-mill.-A double-Heweriner variety is ermmon in gadens. A very beatiful varicty, calleal Inosif $\mathrm{I}^{\prime}$, beenuse origimally found in Jrelame ( $l$. strictus of some botanists), is remarkahle for its reuse, compact, and erect lomaches. A lwart kiml of F . $(U$. netms $)$ necurs in sume places, and is perhaps also a mere variety : if so, there is only one suecies linown.

In fox-hunting countrins, I. is cheoumared on account of the exeellent rome it aflorels. It is also a favourite cover for rablits.

FUSE, FUSEE, a tule of woorl or metal, berforated lown the side with a vertical row of loles. and used for tiring shells. The tulse is filled with a compusition of nitre, sulphur, and gunpower, which will burn gradually. The distance between each hole representing a second, the range and time of thight are computed. and that larse is left open which will communicate the fire in the fuse to the loaled shell at the monent the latter touches the errumd after being discharged. Of course, when combustion reaches this aperture, the shell is hurst by the explusion of the contained gunpowher: and seattcred aroumb in numerons fragments. Fuses constructeal on a similar principle are used in exploding military mines ( q .5 r ).

FUSELs or FOUSNL OIL, known also as PuTato ipient, is a frequent impurity in spirits distalled from fermented potatocs, harley, rye, \&c. to which it communicates a jeculian and ofiensivo olomr and taste, and an unwholesome property. Pering less volatile than either alcuhol or water. it acemmulates in the last jortions of the distilled lipuor. Accorting to Liehing it is principally formed in the fermentation of alkaline or nentral liguids, while it never oceurs in acidulous fermenting thids which contain tartaric, racemic, or citric acid. It mainly consists of a sulostance to whieh elremists have given the name of amylic alcohol, whose composition is represented ly the formula $1 \mathrm{IO}, \mathrm{C}_{10} \mathrm{II}_{11} \mathrm{O}$. It is a colourless limpid thid, which has a persistcont and oppressive ulour and a burning taste. It is unly sparingly soluble in water, but may be mixed with alcohol, cther, and the essential oils in all proportions. Auy spirit which produces a milky appearance, when mixed with four or five times its volume of water, may be suspected to contain it.

Fusel oil is primeipally sold in this country for the
purpose of yielding pear essence for the so-called jargonelle-drops; it has likewise been patented as a solvent for quinine ; and aceordino to Lielig, it is sometines employed in lighting dintillery buildings.

ITUSE'L1, HeNFy, the second son of John Caspar Fuseli, or liuessli, a portrait-painter, and inthor of Limes of the sums Irfinters, was born at Karich in 1742. He stadied in his native town and at lerelin, travelled with Lavater in 1761, and then went to bindand, where, by lieynolds's advice, he devoted limself to art. In pursnance of this object, he proceeded to Italy in 1750, where he remained for What years, studying in particular the worls of Michad Angelo, and in 1775 returncel to linglame. la 1790 he was clected a member of the linyal . Acalemy, where, nine years hater, he beame pro1 'ssor of painting. He died at P'utney Hill, near Lombon. 16 th April 1895, and was bririer! beside his friend, sir Joshua lieynolds, in St l'an!'s. His most remarkable works are "The lihost of Dion, inwo Plntareh; ' lady Mlacbeth;" "llereules and the Horses of Ditmedes;' and his 'Nilton's Gallery', comprising th designs from Parudise Lost. F'.'s imarination was bold, but coarse ; he had mure genius than art ; and his excention was oiten spasinodic in the extreme. Jlis art-riticism, howerur, strange to say, ranles among the loest in the lanquage his literary works, with a uarrative of his life, were published by Kmowles (: vols, London, 1831).

TUSIBl'LITY. With few execptions, all solids which ean bear a high temperature without undergoing ehemical change, may be melted. Nany sulbstances which are populary regarded as infusible -as, for example, platiom and tlint-readily fuse before the oxyhydrogen blow-ipe, or between the poles of a powerful galvanic battury; even carbon has been partially fused by the last-named means. There are many substances which camot be nelted because they are decomposed by the action of beat. Thus, wool ant many other oranic componnds are deomposed into certain gases, which eseape, and into carhon and fixerl salts, which are left. Similarly, carbonate of lime (challi) is deeomposed into carlonie acju gas and lime at a temperature below its fusing-point. If, however, we prevent the gas from eseaping by contining the earbonate of lime in a lowmetically closed erun-burel, it can le melted at a harh furnace-heat.

A table of "The Order of Fusibility of the Metals" is criven by Miller in his Llements of Chomistry, od edition, vol. ii. p. 29)

FUSIBLE IIETAL. Fusible mutal is composed oi $\because$ drerts of bismuth, 1 of leal, and 1 of tin. It fuses at 20 ) $F$., liecoming pasty lufore it completely melts. It expands in a very anomalous manner; its bulk increases resularly from $\forall^{3}$ to $9 \bar{S}^{\prime}$; it then contracts gradually to 131 ; it then expands rapidly till it reaches $1 \% 6^{\circ}$, and from that point till it melts, its expansion is niform. The faeulty of expanding as it cools, while still in a comparatively soft state, renders the alloy very serviceable to the die-sinker, who employs it to tust the aceuracy of his die, every line beins fathfully reproduced in the cast mate of the alloy. The proportions of the thre metals are sometimes varich, nial another formula is given in the table in Fusive AND Fhe:mang Puicis.

FUSIL (Fr. fusee, a spindle) is represented heralaically as longer and more acute than a Josenge (q.v.).

FUSILIE'RS were formeny soldiers armed with a lighter fusil or musket than the rest of the army; but at present all regiments of foot carry the

Entield ritle. Fusilier is therefore simply a his. tonical tifle borne by a few regiments-viz., the Soots Fusilirr Guards, the Eth Northmberland, Fth Lossal, Elst North Jiritish, 23! Welsh, STh Frish, lolist and loth Bencal, 100d Madias, and 10:id Bombay fiusiliers.

FLSSING ANI FREEZLNG POLNTS are terms appled to the tompurature at which soling assume the liguid form. and lidnid. berome sulid. 'llue followiner table gives some of the lest determinations of the fusing point:

| Mercury. . . - 3.92 |  | - , ${ }^{\text {a }}$ |
| :---: | :---: | :---: |
| Oh of ritriok, . -30 |  | :3, ${ }^{\circ}$ |
| limomine, . . 90. | ATH, | $41^{\circ}$ |
| Whi of turpentine, $\quad 18^{\circ}$ | 1s:ammti, | :102 |
| Iens. . . . ites | Ditate of sula, | $\therefore 1^{2}$ |
| lard, . . $\mathrm{H}^{\circ}$ | L.emd, . | 1 $211^{2}$ |
|  | Nitriate of rotash, | -1.2 |
| l'atussium, . . $136^{\circ}$ | Kinc, | 7.:30 |
| Y゙Mllow war, . . 143006 | Antmuny, (about) | 1419 |
| swaric ackil, - 158 | sulver, | 19:\% |
|  | Colper, | 1940 |
| Fusibie metal 31 b , 3ch, | Guk, | -114, ${ }^{2}$ |
| $8 \mathrm{Sl}^{2}$, | Citat iron, | ;8 |
| Lodme. - $20{ }^{\text {a }}$ | Wrought iron, higlar |  |
| Sulphur, . . ²j ${ }^{\text {a }}$ | thun | -39500 |

We see from this table that allors may have a fusing-puint far bulow that of any of the metals which enter into their composition. Similarls, mixtures of rarious silicates fuse at a temurature fre below that whioh is required to melt any we of them, and the same remark abllios to mixtures of rarions chlorides, carbonates, \&e.

Most solids, when leated to them fusing-point, change at once into perfect liquids; but sume-a, for example, platimmo, iron, glass, phosphoric acil, the resins, and many others-pass throngh an intermediate pasty comdition before they attain berfuct lluidity, am?, in these cases, it is dillicult, if not impossibla, to determine the exact fusineprint. This intermuliate condition is termed ritcous fivion, leeanse it is a characteristic property of mass. It is in this intermediate state that glass is worked, and iron and $1^{\text {latinmm forged. }}$

As a general rule, the freezing-point is the same as the fusing-wint-that is to say, if a subatince in the liguid furm be cooled lerow the fusine peint, it again becomes solitl; but there are asses in which we can cond a liquid several derrees lolow its fusingpoint; thus, ly keping wator perfoetly still, we com conl it to 5 . or eren to 1.1 lefore it freeres. II, howevor, we drop a soliel hody into water in this combition, on if we shake the vessel containins it, consolation berins at unce, and the temperature rises to B2. Jhis phomomon is exhibited to a still מreaterederec in visedilluids, like the oils. It is well known that the freczinepoint of water is depressed lyy the mesence of salts. Thma, seawater frecses at abont 206 , and a saturated solution of common salt must be cooled as low as 4 lefore irceaing. Despretz has given the freezingpuints of various saline solutions at different degrees if concentration in the fourth volnme of the Compies IEcmlus, 1. 4:50.

IUN'IIAN, a eotton fallric having a pile like vilvet, but shorter, and which is manufictured in mearly the same manner as velvet-viz, hy leaving loops standing upon the face of the faliric, and then eutting them throng so as to form "pright therals, which are afterwarls smoothed by slaciug, sinereing, aul lornshing se Velver.

EUTCLE DEBT is a dut wheren the whata tion to ply ant the time for paranent is tixerd and certain. bit the day for performane las ant arrivel. Of such a deht, it was sainl in the civil law dhes reftit this nondum ornerit : and it was distimanishel from a contingent debt, i.e., a delit payable on the bur formane of a condition whell was mentain, in which it was said dies now moth noe emit. Thus, : m obligation to doy six menthe lume in a future delat: an ohbigation to pay` if my shipreturns from span, is contingent. In the orent an the wath on hame rupter of a person haviag latre eommeratal tansaetions, it is often of great imporame that the right of the hadurs of such securitios shamh he acumately dixeal. In lames, on the death ar bankruter of a citizen, a creditm halling a cham tor it fiture delot was entitled to payment, doductins a percentage propmrtionate th the date at which his oloht was parable : lout a continunt ereditur only recemed a sccurity for payment in casc his delit shomld become payalole. This sheral principle has been introlucel into the legal systems of mulem states. In Holland and in Francic, the riohts of crulitors having clams mot immediately payable are hased upon the rule of the civil law. In Englamb, a finture delat, in onder to fomel a radid clam, must the in writing, lont it may he comstituted hy lwom, lial, or note or other security. By common law, such a clatim coulh not he enfored until the actual time for phyment has arrived; and formerly, in case of batheropter, a ereditor on a lebte of this kiml was not allowed to insist in his cham. At the same time. the hankupt's discharge was held not to moase him from it delit which hal not heen almitted to cham in the process: and heme delpors were smanetimes incarcerated for years on delita whinh they were wholly unabe to ilischare see ImersostMent Fur Devi. This state of things was prolactive of manifest mjustice on luth delitor and crelitor: wn the lattor, loy excluding him from insisting in his clam at a time when he might have
 pmishins him for his tiffult whon he was herived of the means of natking any return. The suligect was frephently disctussal in parlament hefore a
 s. 51 , it was enarter that, in cases of hambruptey, where a chit was not immediately payable, the cretitor shombl be entitled to pore his debt, and
receive a dividend, watatime interest at a per cont. fin the perionl which was to dajue before the date whon the dold was payble in hom eomese. By s. 50, lelots payable on a comencency mint be valued, amb a divalemb pand an the estimated value. Similar provisions were inserterl in the 10 ame l:f Vict. ce.
 -4 and $2 . j$ Viot. c. 1:31, s. 1-33, it is matem that a persm having a elaim for muliguidated damages, wheln are of the natum of a future lelet may have his raim assussem hey a jary ither in the eoont of enuity, othen a inmanh-law juder, ur, in case of abreement letween the pation, bey the cout without a jury.

By the common law of Seatlam, the rule of the civil law, as to the rights of croditors hawing a fature clam. has always loen reconnised. In thaevent ai bunkrupioy, creditors in lwth fiture amb contingent dehts are alloweal tor ramk. lout the latter moly to the extent of receriving a somerity matil the

 it was supphanted by Luchanw, which lay abont 00 milh's to the west, in the direction of the nenly acepured territory.

THE sereath letter in the Roman alphant, amb in the moden alphabets derived irmen it. For the history of the chanmer soe Alphaber and lutter $(\therefore$ The origimal and proper mand of $A^{\prime}$ (correswonding to Gr. $z$ ) is that hearl in gran. grite glied. Ihat the sane natural prucess wheh tumad the lannme of $e^{\text {before } e}$ and $i$ into that of $s$ (s'e ('), mantued a similar chandry on G, so that locine and it came to he pronounced by the Latins have deh. The sibilation of the hitere $y$ hefore $i$ followed liy a rowed, had begou as early ats the the c. A.ro, as is evident from the misspulling in inseriptions; in the case of $c$, the chanso can be letected much earlior. From the Latim, the divesound of If lassed into the Romanic tonsues, and also into English. As a general rule in English, in words derived from the classical and Rominic langrages, ghas the hissing sound hefore $\therefore$, and $y$; it has its natural soumi in all worls before $\alpha$, $o$, and $u$; and it retains it in Tentonic worls even lefore $e$ and $i$.

G, in its proper power. 1 eclongs to the orler of gutturas, $k$ or $c, g, c h, g / k$; ${ }^{\prime}$ the two 'bare' gutturais, ! is the fat (or melial), and $k$ the slustp: while gh aud $c h$ are the corresponding Aspinatos (1.v.).

The following are some of the interebanges between! and other letters: Lat. uger. Gr. ayrus, Ener acre, Gor. ucker ; Trr. triakonta, Lat. triminta; Gir, gomu, Lat. gomu, Eng. kupe: Lat. (g) nosco, (ir., gi-
 ber. gens, Ding goose and fometor: hat, hesthmus, fere ytisten, Eing yester (day); Lat. y memes, Span. hermam. The convertibility of $g$ and $!$ is seen in the old English participles in $y$, as yched, corresponding to sax. and Ger. ge- ; in Ger. foll, Eng. yetlow; Ger. toy, Ens day; Ger. may, Ens. may; zete for gate; yard for garden, Lat. horitus. in Italian, if is sunstituted for $j$, as crintio for Jotius: and in French, which has no ur, that letter
 Lng. war, warl or guard. G has been frequently droit out, as Lat. nosca for mosen: Eng. mough, comparel with (res. genuy; ayone with ge-gungen: Lat. muyistor. Frs maistre or matere, Ens master. Moy, Lat. Meils, contracted from Mayius, is from ar rowt mut, or (sans.) moh, to grow: so that May is just the season of growth.
$\mathrm{f}_{\mathrm{f}}$, in Insice is the fifth souml of the matural datonic scaln wi C . and the eighth somm of the Cumatic scale: It stands in promention to 0 as 2 $t_{1} 3$; is a Inricet fifth ahove ( 1 , and the second hamanic arision from $1:$ as a fondamental note. In 1 hes : olmisation of fruides Aretimes, the note $\mathrm{f}^{\prime}$ Was allal ion Jie or Lt, acording as the hexaThore ing with $C$, F, or (t. it major ath a key has one 'hap at its siqnature, wio, F , tharl. is minur hats two flats at its sigmature, viz., lif that and b: flat.

GidiLe Jozief, a Hunginian author, was boru at

Nagy Karoly in 1811, studied at the college of Bnia, and at the university of Pesth, and entered soon afterwards the alministrative carcer, being attached to the Ihangarian Conneil of lientenancy. G. began witing canly, and proved equally successful when gossiping in the columns of Kossuth's famons Pesti Mirlup, and when engised in translating a masterpiece of Cervantes, filling the periodicals with tales and novels, or furnishing original works for the National Theatre. The sketches of countrylife as it was, and as it still continucs on the vast plains of Hungary, are mowhere to be found more vivilly and more truly exhilited than in G.'s comedies and tales. The following are some of G.'s uricimal compositions: S'irmay llona, a nord in 2 vols. (Pesth, 1836) ; Peleske Fotarius (The Notary of Peleske, Pesth, 1538), a comedy in four acts-might be called the Hungarian comedy par excellence: Szatoplule, a tragedy in five acts. Tales: Pusatui Kalund (An Adventure on the Hungarian lrairies) : Tengeri Kulund uz Alfoch doen (Seafaring Adventures in Lower Hungary) : Mortobagyi ejszaku (A Night on the Ileath of Hortobagy). During the sojourn of the Humgarian Diet at Dubreczin ( $\mathbf{I} 49$ ), 6 , was elitor of a journal combating extreme radical views.
G. ${ }^{\prime}$ BDRO, the name given by ltalian geolugists to a varicty of greenstone composed of felspar ind diallage. It is cumalent to enphotide or diallage rock.

Gabelentz, Hass Conon yon mfr, a distiaguished German philologist, was born at Altenhurg, 13th October 1807, and educated at the universities of Leipsic and Güttingen. In IS33, he published his Eloments de la Grammaire Mandschoup, a new grammar, in which the entire idionatic character of that languige was developed in concise rules. ITe hanl, moreover, a share in the establishment of a joumal devoted to Oriental science (Zeitsehrift fiur dio k゙unde des Moryenlandes), and contributel to it some interesting papers on the Mongolian language. Along with J. lüne, he also published a critical edition of the Gothic translation of the Bible by Ultilas, with a Iatin transkation, and with a (bothic glossary and grammar appended (Leipsie, 184: -156). Gr. was also the first phenologist in Ciomany who modertook a scientific treatment of the dialects of the Fimuish-Tartar stem. Besides a Syrjan grammar (Gruntzige der Sypienischen Grommotik, Altenbug, 18-11), he fmonished contributions to leriodicals on the Mordyinian and Sanoyed lamgages. He has sinee published some contributions tw the science of languge (Beitröge zur sipuehonkute). The first threc parts were issued in 1852, and the first volume of a collection of his Philological Fragments (apmecheissenschafilicke Framment anpeared in 1559 , and a Disscriatinn on the Passive Voice (Ueber les Peessievom, Line sjmucherofleichende I bhandlung) in 1860.
G.DBELLE, a French word, derived from tho German ciche, gift or tribute, and originally used in

## GABION-GADIRIEL

a general way to designate every kind of indirect tax, but more especially the tixx upon salt. This impost, first established in less, in the reign of Philippe 1 V., was meant to be ouly tempmary, but was declired perpetual hy Charles V. It varied in the difterent provinces. Those that were most heavily taxed were called pans ole yrombe grabelle, and those that were least heavily taxeel, puys de prito grebelle. It was unpopular from the wry first, and the attempt to collect it oreasimed frequent listorbances. It was finally sumpessed in 175\%. The name yublous is, howeria, stil! given by the common Irenile in France to tax-gatherers.
(AABION (Ital. fublim, relatert to Lat. werm, builew), a kullow eylinder of basket-work, cmphyent in tieh or tomprary fortifieation, and varyins in size from a dimacter of 20 inches to $f$ fect, with a leeight of from 2 feet ? inches to 6 feet. In wonstracting it, stout straight stakes are phacol uprinht in the gromed in a cirede of the required diancter, amd are theo wattled tegether with asiors or green twiys, the in the formation of haskets. The alparatus being raisel, when completed, from the wommed, the ends are fastened, and the gahmon is ready tu lue rolled to any place where it is desirable to form a hreist-work against the cnemy. d'laced on end, and filled with carth, a single row of gahions is prowf, execpt it the pmints of junction, againat musketry fire, and he increasinys the number of rows, any degree of security can the obtaince. The mabion las the alrantage of being highly portable. from its shape, while with its aid a prapet ean lie formed! with far less earth, and therefore in less time, thin in cases when almwance has to be made for the slopes on both sides, which are wecessarily present in orlinary earthen walls. The sap-rollir consists of two concentric galims, one 4 feet, the other ? fent 8 inches in diameter, with the space betweon them wedpol full of piekets of hard wool. In sapping (see Minsa), thase serve as substitutes for mantlets.

Ntuffol fothons are sabions rammed full of broken lranches aml small wool: being light in weight. they are rolled before soldiers in the trenches, and alliral some, harugh mot a very efficient, protection against muskety lire:
 trops as a doface, after heines driven back from "ther mone sulid pusitions. In earrying is wellWefembed fortress, sabimmade after sabiommade lazs sometimus to be stomme before the lusioged can be compelled to surrember.

GABLAL, the triansular part of an exterion wall of a huiding leetwem the top of the side-walls and the slopes of the ronf. 'Whe whole wall of which the qable forms the top is called a sablecend : partywalls, or the walls which separate two montigums houses. and which belong "fuctly to both honses. aro called in sootland "mutual walbles."

The getble is one of the most eommon and chameteristic features if Gothic architecture. Tlae cond walls of classic buldings had Pefliments ( $q$. r.). which fullowed the slope of the roofs, hat these were always low in pitch. In medieval arehitecture, grables of wery ande are uscal with the atmost Frechman and when covered with the momeded and erocketal copes of the richer periols of the style, give wreat variety and beaty of outline.
Gublew, or smill gables, are used ingeat profusion in the more decorative parts of Gothic arehitecture, such as eanopies, pinmacles. de., where
they are introluced in andess variety along with trandy, crockets, and other whichments.
The towns of the midule abot hat sumost all the gaikes of the honsed toward the strects. producing meat liversity and picturesumens of eflectas may still be sem ing many towns which hatye born littie. moxdernised. The towng of Bolgima and Gomany apecially still retain this meabobal arrangement. In the liter Gothic and the Renamsance purimbe the simple outline of the pably locotane stepped and broken in the most fantastio manner. Seo Cobbie Sters.
In Scottish law it matual galke , w party-wall, thongh patly buitt on the indoming property, belongs to the builder, and he can prevent his winhour from availing himself of it for the supmot of his honse, until he has grial half the expernse of buiding it. ## GAELIC LANGCAGE AND LITEliATUIE．

the morthern hanch of the coltic languages， comprehending the Irish，the Mhamescottish，

 fication，it desimates the Mighlaul－seottish dialect， alio known by the name of Lirse or lrish．Nr W F．Skat，one of the lateve and lose informed writers on the subject，hodes that the diflerenees
 Landors and the lamanee spoken by the native lom are（1）＂partly in the promamition，where the arecutuation of the languge is diflerent，where that peculiar chanes：in the initial consmant，pronlucet by the influence of the previons worl，and termed by the Irish prammarioms eclipsis，is monkown exeept in the sililamt，where the rowel summes are diffont，and there are even traces of a consmantal permatation：（2）partly in the frommen，where tha Fontish（arelic prefes the amalytic firm of the Ferh，and has no present tense，the old present heing now used for the future，and the present formed ly the auxiliary verh，where the pheal of one class if the noms is formed in at pechlaterman－ acr，resembling the Aumbinam，and a difierent nerative is misel；（3）partly in the íliums of the hagnag．where a meater jrefreme is shewn to expros the dual lew the of sulatantives，and the vort is anximsly avoided；and（f）in the encelotery， which varies to io considerable extent，where worla now olosolete in Irish are still living words，ami others are misel in a different sense．－The Beom of Lismore＇s Bow introl．Yp．xis．xs．（Edin．1sh？）．

The arigin of the difternees thus deseribal is a question still in dispute．Dlr sliene contends that they are ancient，and conter into the orpanisa－ tion of the lanemate．The lrish selolars，on the other hand，hold that they arecomparatively mokern aud mimportant，and little more than provincial corruptions of the mother－langage of Irulami．The late fir lichard Garnett，whe of the most learmol of English philolonists，is on the Trish side，hombin－ ＇that Irish is the barent tongue，that scottish Gaelic is lrish stripped of a few intlections，and that Manx is merely（iaclic with a few pectliar words，and disguised by a comupt system of urthon－ graphy；and，aqain，that the langmase of the Sonttish Highlauls＊does not differ in any essential print from that of the oppusite coast of Leimster and Ilster，bearing，in fact，is closer resemblane than Low（ferman does to llich（ierman，or Danish
 （loml．18．59）．That the north of Irelam，and the senttish Highlanls aml West lslands，were，at an early perion，pended by the same race，or rates，is admitten on breth sides．Dlr skene further admits， that from abont the midale of the 1．the c．to abont the midule of the 16th e．，1rclam exereisoll in powerful literary intlume on the seottish ligh－ Fands；that the 1 rish semachies and loards were heads of a schond which inchuled the West High－ lames that the Highland semachice were cither of lrish desecnt．or，if they were of mative origin． resorted to bardic schools in Ireland for instruetion in the languate and the arcomplishments of their art；that in this way the lanmave and literature of the Sicottish Highlands most have become，by degres，more and more assimilated to the lagate and literature of Irelanl；and that it may well be doubted whether，towarls the midulu of the 16 th $c_{\text {．，there }}$ existed in the scottish Lighands the means of acquiring the art of writing the language exeept in lrelank，or the conception of a written and cultivated literature，whicll was not identitied with the langrace and learning of that island．Mr Skene holds，it the same time，that a vernacular Gaelic，preserving may of the independent
foatures of a native lamenas，wisteal amone the Seottish Hibhlamders ats a spokion dialect：ania
 that mative and inlumatee farelie，in the $I^{\text {nectry }}$ hamdal down by trahtion，wr conqu．．al by mative bards immoent if all extranerns celacation in the writen language of lraland．

The first books pinterl for tha use of the boottish Highlumbrs were a translation of Kums l＇rayor bonk in 1567，ly fohn larsewall，bathe of the Fsles：a transhation of（alvin＇s Caterhism，an 10：31；
 and completed in lo：M：and a tramskion of the bible published hy the lier．Ralnert Kirkn，ministe 1 of Batuhhither，in $160 \%$ ．All these worthe atre in the hrish urthography and lrish dialect；the last－ mentionel work，imken，is mothing more than a reprint of Lixhoge liedell＇s lrish wersion of the Bithe， with a shom vombulary of senttish bamlic wome，

Gilla'Tlid was in ancient times the name of a contutry of Asia Minor, inul was so called from a bondy of Giauls who settled there. ln the Sal e. nc., great hordes of Gands, under Brennus, invaded trreces. Fiome of them thak luseession of liyzantimm and the Jropantis, passed the Hellesiont wn the invitation of Xicomodes, king of lhithyuia, in the your 278 n.c., sublume Trons anl the month of P'brygia, and were tirst therknd ly Attalus, dinn of l'ergames, in a ereat latile shmot the year as9 rer., and compllad hy him to sottlo jemanently within certain limits. The state of fi., which litherto had hat no aceurately defined boundaries, was now contind between laphlaMruat, Pontus, Cappadocia, Lyewnia, Plarygia, aml lithyna. It was also eallud dallugraccia, and was poopled liy numbers of lhasgians, Grecks, and Paphlagnions, as well as timuls or C'elts. 'lhe form of govermment was at tirst purely aristocratio. but at a later prion the twelve tetrarchs who shared the envermment amone them, in eonjunction with a senate of 300 m malsers, succented in making their dimity herchitary. At length one of then ( $30 \mathrm{D} . \mathrm{C}_{\circ}$ ), suppeited by Pompey, assmmed the title of king. Stter hishath, the kinghm descended to Amyntas, lant was shortly after concuered ly the Fimans, and converted into a Roman province divided under Theodosins into Cintatio prime, with the eapital Aneyra, and Cichotice secumb, with the capital Pessimes. The majnrity of the Ganis of $G$. retained than old Celtic language as late as the time of Terome ( 4 th e.), who says that they spoke the same dalent as the pende abont Treses; and as Jerome lad himseld lived there, and was a gool scholar, ho may te regardel as an anthority on the suliject. (i. Was twice visital by the Apostice l'and.
 was written by the $A_{\text {justle }}$ loul luming his residence at lephesus, Irolbably abont the yew for d. I., and is geverally reckned the third or fourth of the limine epistles in the arder of time. The circumstance which called it forth was the dithosion, Hhrmuhont the dialation chmelhes, of Judaistie protions and motions, chief amony which stood the fammus rite of circmmeision. regarded by l'aul as the symbol of all that was exchusive, external, merely
ethical, and therefore thoronghly antagonistic to the universality of the gnspl. Paul had himself heen the dirst to preach Christ in this regrion, amd as the majority uf his converts were contiles, it would naturally vex him all the more keenly to see them lapsing into practices ineonsistent with their new faith, nul for whiel they han not even the exeuse that might have lown proffered for the Jews, rif., that antiquity hand miule such customs vencrable. It wonl also apmar that the Julaising miversaries of Panl had hern circhlating injurina reports concerning himself, hintins that be was und divinely appointed apostle, hut at best a mere messenger of the elhureh uf Jerusalom, that he had quarrelled with Seter, the preat aloostle of the circumcision, aml that he eond phay fast and loose' on this very question of circuacision itsplf. In his reply to the umberham attacks of his calumniators, l'iul asserts the truth of his fospel, passionately deckring that he vould pros nomece it curse on the bery angels from hearen, if they would dare to preach another, vindieates his apostleship, and gives the true version of the story of his variance with Peter. He then proweds to discuss the relation of Iudaism to ("luristianity, and closes with a scries of whotations and inlmonitions, tha first of which is the well-known 'stant fast therthose in the liberty wherewith ('lorist hath made us free, amd be not batanded again with the yoke of bondage' (i. 1). The commentaries on Galatians are very wancrons: among others may be mentionel those of Lather. Win's, litickert, De Wette, Meyer, Ellieote, ami Alforl.
 the sontly of Jtaly, in the province of Otranto is situated in a fertile but unhealthy plain, 13 miles south of the town of Lecee. Some mantain that it is a very ancient phee, lut there serms no historieal ground for the assertion. (i. is a thriving conmercial town, and possesses fine phblic elifices and handsome churehes. Pop. Stom. Ramonlo Orsino, I'riuce of Taranto, and lami of Cialatima, surmondel the town with ramparts, as a tribnte to the citizens for liavius ransomed him from the 'lurks fur Iz, (0)W ducats.

 turing tomp on switarlinm, capial of the canton of the satum anan, is fhensantly situaten om the left bank of the shemalh, at an clevation of whsi feet
 in a strabht lime east-northerast. It is a well-huilt town, summubel ly whalls; lint the ditch has lay filhal up and converted into garden-grames. Amone the frineipat buitinge are the Ahery (lhweh, whidh was completely modernised in the chnes of last century; the monastery, portions of whith are nuw wechigied loy jublic govermment whics, ath by the convent library, containing leng Msis, and among them several of the chasion, that were at one time thought to have leen lont. Sou (timb, sl. Aemaz of. The greatest buiding is the shanlhuse, which contains a matural history mus lam and the town hibrary. The manafactures if it (i. comsist chiefly of cotton genols, particmarly if sean muslins. It has also limen manufactures, c:unins on bleaching and embruidery extensively, and is the wreat mart for the proluee of alpenzell

 loutel nwiss lionalictime monastery, which gives its ume to the canton in which it is situatel. It was fommed arly in the Jthe by Ne (iall, or (Giallu*, au I fidu monk, a disciple of (columbamos, and mie of that distinguished lanal, whe in that az-. from the varims monasteries of lreland ame the kimilrei cotablishment of lona, carried the chemonts of $h$ anins and civilisation orer a large jortion of tho continent of Emope. Gallus had acempanied (idmmanus to Ancyray and Luxenil, and ultimathly himsedt. in company with a fen followers, ramal th suitzelant, where, in a hermitage on the latus of the steinach, he acquinell such fame for sanctity hy his teaching and example, that on his death, there amse, in honour of his memory, what, in propess of time, lecane one of the most whtrateil if tho many maznificent estahbishments of the Shmedictine order. The successime of ahbuts fron the days of gallus is earefully chronichen, and the shato which rach of theon lail in tha arection and colarement of the manastiv lomihtimes. It will l... vanub to say that, thround the piety athl manition he of the faitleful, the abloy of sit (a. Eminally locame one uf the master-pines of Pambal ablutwote ; and that the ornins and skill whid were lavi.herel on its mostrastion, and on the ducnation of ita halls and doistors, had at lape share in Awpupis the christion art of the J" man. The nomks of sit (t., tom, may be reckomed ammer the lase frimels amb prespres of andiont bumature. They were indefatigable in the corlow
 stemel athl profithe history, classical, litugical, amb

Ipecmliurs. Sume of the 11 ss, which are still shewn in the harary are momments of the skill and imhentry of the erpigists: and several of the classics, "serially
 han: hase heon preserved solely through the Mss. of st dall. For a time, the abley was subject to the Bishy of Constance, and an amimated dispute was fur a hong time maintaimel between that prelate ame the mombs as to the rught of electing the ablat. It ended, howerer, in the recomation of the risht of free dectinn: and ultimately, from the !rowth of the momastic possessinns, and the important prosition which the aboot hell, the monastic dmain, which comprised a great part of Northern switzerlaml, became a distinct jurisdiction, within which the abbot, like many of his hrethren in the Iteat Benclictine monasteries, exercised all the lishts of a suactain. Fior several centories, the ahbey of st di. hell one of the lighest places in the oriler. Its schools engoyed wille repatation. Its members hedil a distimaishod flace anong the selholars of medieval Germany; and many of them, as, for example, Notker, are known to have cultivated mot only the ordinary learning oi the schows, lout also physie, mathematies, and istronomy. The school of Sit (d., tor, was one of the most eminent for the cultivation of music, and its MSS., preserved in its libury, have been extensively mate use of hy the restorers of ancient ecelesiastical music. A town of considerable jmportance grew up aromad the monastery, and was ealled by the same name; and as the wealth and inthence which attaehed to the dignity of the abbot began to make it an olject of anbitum to the rich and powerinl iamilies, we find the succession of abbots, in the 13 th and 1 fth centuries, sadly degenerated from their pions and learned melecessors in the oflice. A stringent refom was enforced abont the time of the conneil of Constance ; hat the lurghers of st ( i , hat grown dissatistical mader this rule; and on the outherak of the Refmmation in 15s. they threw of their subjectiom, and embraced the new doctrines. it the duse, however, of the religions war in 15.3. the Catholic religion was re-estallishet, and the abbot minstated, thath with diminished authority, in his ancient dignaty. At the French liewhition, the ahmey of St fi. was secularised ( 1 TOS), aml its reventes were som afterwards sequestrated (150.5). Iby a later vechesiastical arrangement, the ahbacy of St 4 . was raised to the dignity of a hishomic, which, in 1823, was united $t$ that of Chur. 'They wore aftervarls, however, separated : and in 1817, Nt. Gallen was erected into a bishopme, with a distinct jurisdiction.
(ADLL, Sr, Cheros of, a Swise canton, lownded on the N. by Thurgan and the Lake of constance. E. by the Vorarlierg, st by the drisons and Gdarne, and W. hy Zarich and schwytz. The country is for the most part mountainons; the general slope of the surface being towards the nunth and nortl-west. Sevoral of the summits attain a height of fono or 7 oro lect. one (the (Gallamba) a height of sotho, and one (schivhe) that of $!$ mols. The libine touches the canton of st $(\mathrm{B}$. near l'foffors, amil for alout 50 miles forms its vastion bomblay. The chief rivers that intersect the canton are the feem, the Tamina, and the Thar: liontions of the Jakers of Comamec, Zorich, and Wallonstalt, he within its lomndaries. The chied presluce of the canton consists of fruit, esjecially :HPles and chories, winc, kirwh hasser, corn, maize, ann potaters. The amount of corn porlueet is hat frithong, and a ensiderable part of the land is duvoted to pristure. Iron is fond in comsiderable abmanace, and of good quality, at Cinnzenberg ; and coal, as also peat, is raised within the canton.

The manufactures ase of linen, muslin, entom, lace, embroidery, and glass: am! wax-hbeaching ami taming are also extensively carricd on, The linentrale is of very old stimuling. Its suat is the town of St Gall, which was colelirated for its linens as early as the lith c., lant it has in later times been almost cutirely replaced ly the manufacture of cotton.

The arection of st $f$. into a dintinct canton is enmparatively uf recent late. It wiss formen upon the secmarisation of the domain of the aboot by the union of the ahbey territory with several districts previonsly sulject to the chlure cantons-viz., the Ehe-inthal, sargans. Werlenberes. sax, baster, Ctanach, together with the town of happerschwyl; so that the new canton of $S$ d $G$, cunally enclosens upme all sikes the canton of Aprenzell, which forms, as it wern an island within the new district. The lanewage is a swabion dialset of Germath. Tho eanton of st $G$. sends cight mombers to the National Conncil. Its govermment is one of the monst inmocratic inswitzerland. It consists of a Cireat commeil, the members of which are chesen for two gars ly the sotes of all eitizons ahow ?l years: amd who arment from amone themsthes for fom yors an exentive, ealled the Lesser Connell, comsisting of seren momhers. The local prefects and other distriet oflicers are chected ammally in their several districts. The area of the banton is 7i- square
 Catholies, amd the rest chiedly Calvinists. Chei town, st fall ( f . w)

GALLA OX, or SAXGA, a remarkable swecies or variety of ux inhabiting Abyssimia. The chicf peculiarity is tho extraoodinary size of the homs, which rise from the forchead with an outward, and then an inward ense, produeing a very perfect figure of a lyre, and finally eurve a little ontwards

at thu tip, to which thw taper fradually: In a specimen presented ly Mr Bult to the Musemm of the College of Suruan in Lambon, the length of cals how measureh romel the outer site is there fout ten amp a half inches, the circmafernace of each at the base is one foot there inches, the ristance between the tips three fert fime inches. A space of about three or fine inclus betwen the hams is oreunied ly a tuit of hair. Pince represents the enornmus prowtly of the horns as a kind of dis. ease or monstrosity, accompanied with emaciation of the animal. Salt controverts this account, but
fienurs the anmal su as mather to confirm it. The f. 0 ., honcerer, diffirs from the commen ox in havins a hamp on the shoulders, in the almupt descent of the back towiats the tain, in the greater longth of the legs, and in the marower space betwem the loms.

Althoush sharing in the wemeral htemary inferinity to their eastern brethren wheh charaterises Western eqclesiastics durins the carly pethel, the church of (ian mumbers soberal minnit names in the literature of the 3l, fth, and ith centurics. The works of henaens, Fisisup of lab, wre among the most important for the hintory of duetrime of all the carly gatristic romains: and in the following century, sulphins sworas, Hary of lontiers, Ihlary of Arles, Vineent of Lurins, l'rosjer, Victor, Encherius, Lalvian, and other writers, emblane to form a bedy of literature of which the later momern representatives of the Trench 'lanch are not momasonably proud. The hacrarchical organisation, alse, of the charch of Ginl was, at a vory early perion, among the most (ounplete and reculiar thronghout the churches of W, itern (hristentom; and in the comeil heht at Arla in : $: 14$, we cren recogaise the titles of many finhops of sees which are still represented in the catature of the French episcopacy.
lint the history of the G. C., so far as resards tha invelamment of those peculiar principles which lave acpuiral a distinctive name and status in Joman (atholic thenogy, begins at amoch later primd. We shall see elsewhere the origin and prepes of the temporal power of the papary. See l'shor. It will le enough, in this place, to inserve, that, from circumstances which are differatly riowed lys the opposite schools of theology, the Finman puntiffs legan, from the very date of the estahlislment of the Western Empire, to exarcise a lure and widely extended influence orer the civil is Well as ectosinstical affairs of the several Jimperan kingems. On the other hand, owing to the intimato connction between the chureh and state in ano of these lingrimes, and especially to the fomlal retutions butween the crown and the ehmech dignitarics. nont of whom hell the temporalities of their lenticess umber the crown loy the minary feutiatory tonure, the erosn also asserted a correlative cla $m$ tu certain mivileges in respect of ecelesiastical athiurs. The satisfactory inljustment of these comtheting claims was the great problem of modieval 1whty ; and the altemations of the strugge letween the mitan the staple of melieval histiry. Dose than rone of the French swereigus engaseel in a contlict With the limman see as the the respective anthority of the two powers; these contlicts naturally calleal wit it insision of opinion among the members of the chareh of france one party suphoting the papal dame, and the other mantaning the alverse prerocatives of the livencl cown, and the privileges of the national clurel of Frame The latter party. profossing to represent the rights of the $G$. (… hise given anme to the principles which the $y$ profoss: and the apmellation of Gallicanim thas come t.) lesiomate, in gencral, that system in Jioman (sothone thandogy which, white it recugnises the primay of the Tioman pentifl, hy divine right, over the miversal church, yet asserts the independence of natimal charches in many details of self-govern-
ment and of lowal disciphine, and limits the exarise of the papal preogatives by canons and decrees of Lencral counchls amd hy the laws of the universal chureh. It must be ahder flat, while the eiallican thow y to this extent clains an exemption from drembence um the anthority of the lioman pritifl, it acpuiesces, on the ether hand, to an almust proportionate legres, in the assmmption of reclesiastical anthority ion the part of the state. Gallicanism, in truth, in many of its details, falls intu the grussest form of Drastimism.

We cin recognise the working of thas prineiples in the "pposition which the so-"alle letitorian becretals (sce lsidomins Jechetals, Hiscmar of linemsis eneomened in Frame; amb althoug the honly of the clergy stoml aloof, they were earried to their most extreme extent ly lhilipe the llandsome in his contest with buniface VIll. The contlictine chams of the rival papes in the Whestarn schiom (s, ene Weaters N(misy) temlcol sthll mone to weaken the paral anthority; and the expedient which was then alopited for the extinction of the shimu-viz, that of converning a gencral conncil tu promonec apon the respective chams of the protemmers to the papaey. gave prominence ant sipnificuncy to what has smee Bean regarded as one of the leadiag dogmas of calli. ramsm-the superionity in peint uf anthority of a general comeil to the jure. The details, too, of the disciplinary enactments of the councils of Constance and Pasel, which ware drawn mp in this spirit, were mainly directed towarls the limitation of the papal authority in the excrese of churd patromage within the limits of the national chureh : and these enactments were in the main embodied into the French law ly the celdrated Pragmatic Sanction of 1438 . See Ifmimatic sisetios.

The lragmatic sanction wis. superseded in 1.512 liy the coneorlat of Leo $X$. with Francis I. The large share in the dispensation of elurch patronage which the French crown enjoyed under that concordat harl the effect of still forther mationalising the Fremeh Chmels, ant increasins the jealonsy of the crown as to the papal interference. The great jurists, Pithou and Duping, in asserting the libertics of the ehurd, equally enforced the privileges of the erown. In the develoment of the absolutism of the monarehy, which reached its hedight under Louis XIV., the ecelesiastical prerogative of the crown was enlarged as much as its political anthority; and a contest which arose loctween this monarch and Imocent X1., on the right of the crown tu the so-callel Droit de Romile (see Liccanis), led to the well-known declatation of the French clergy in 1659 , which has since heen regarled as the charter of (iallieanism. This formulary emanated from an assembly of the French clergy, held ly ruyal anthority in 1682, at which the celcbratel Bossuct was prescht. It eonsists of four articles. The lirst delares that the jurisilic. tion of St Peter and his successors in the loman sec as vicars of Christ on carth, althourh divincly bestowed, is confined to things spinitual and appertaining to salyation, and does not extemd to evil or temporal atbars.' The article therefore declares 'that pinces are not snliject in temporal things to any ceelesiastical authority;' that they camot be deposed 'either directly or indirectly hy the power of the kevs, and that their subjects comnot be diz. ]ensel from their sulijection or releaserd from their ahlegiane.' The secom article renews the declarntim of the council of Constance with regard to the sipmeriority of a general comecil over the pope, and delares that that article is not to be restricted in it:s application to a perion of schism such as existed at the time of the council. 'lohe third asserts that the autlority of the pope is to be restricted by the

## GALLIENLS-GALLINACEOES BIIDS.

canons of the miversal church,' and that 'the rulos, enstoms, aml institutions of the frallican kinglom ant charch remain in full force.' 'This is the article which asserts the echerated 'fallie:m liberties.' The fursth article, while it eonceles to the janme 'the chief f art in questions of fath,' and pronesses, that "his lecrees extend to each and every" charch, nevertheless mantains 'that his judment is mit irreformable, unless it shall have hen confirmed be the consent of the "ntire chureh.' 'The chiof rulec. customs, and institutions of the (i. 1'. reforred to in the thind article are, that the 18 . (') lones mit perive all the derrees of comneils and of peres in matters of discipline, and that thase ondy ame in force which are so receivel: that the (: C. hohls itstlf free tor receive or rojoct the rulne of the loman chancery ; that the lioman pontol cambet levy any inmost from the Frowh clerey withnat their own consent; that lue comment heotow of his "wn motion on a foreigner my bendee within the French Church; that neither he mor his legates wan hear French canses in 'the first instance, am that even in cases of appeal he is lomad to asibumative julges to hear the appeal, evon whon the apmont should be a motropelitan or pimate: that the French bishorps chail not ve repmed terattond any gencral comeril unless with the permission if the crown. The lait of these 'customs,' as also thme which make the receiving or mot recciving the general canms of disciphe optimal in Framee, and which practienly throw the decision into the hands of the civil linwer, have hech with muth show of reason domminated the 'Slawertes' rather than the 'Liturtios' of the fanfican Church.

This 'Declaration' was strenuonsly enfored ly Louis XIV: It was imposed u!en the miversitie's and all public ceelesinstieal hotios, mut its accentance was made a comblition of arpmintment to offices in the church; hat it was in the sume poprortion distastefnl to the popes. It was comdemned by
 and again ly lins l'l. in 1704; lut looth the aceptane of the artiches ly the French cherg, and the combemmaton of them by the loman Imatifs, are umbernomi to be with certain reservations as te the particular doetrines. Within the present contury, and especially since the late collision butween the cina and exelesiastical anthority, the ginions of the Frenk clesy have undergone a decided chaner, 'lhe Ciallicon dectrines are now much less commonly luht, and in a less extreme form. The same dectriues wher alsm adented in ather mational chameses ant experally in the ecelesiastical prineipalition of (emmany (sce Fembentwosh) and in the dimman cmpise mider foseth 11 . Here, alse, they have fallen into diacralit with the churd parts.

(:ALAS, or GALL.NUTS, are of varions shapes, hut the onk-galls chitfly used in commeree are nowly flobular, with slightly finted excresences sparimely placed on their surface. They are romatable for containing a peouliar acid eallow frllie, which is only an altered contition of tamie and, anel their value is entirely che to the great armmalation of this principle in the diseasen condition of the vegetalle tissue whide constitutes the wall. This galle aed ( 4. . .) is easily separated in the form of heatiful white acicular erystals, which, after a little exposure, become pate jultow. It is in "xtomsive demanl as a fixing abent for phato. eraphic pictures. Entil this demand was reated, chly three or four lieds of galls were known in commere, ant these were almost wholly empheyl for dyenes $\mathrm{p}^{\text {mupures, a small quantity of the common }}$ T"ukish gells being also nsed metieinally; now, several athers are morted in considerable quantities. The followine are the chief:

1. The 'Turkish malls, of two kinds, lue aml white: these are liy far the ninst commen in use. They are chedre imported from Constantinctu amb smyma, from which filues the average imports of the last five ycars have amonted to :\%ot thens-an enmmons frantity, whon we consider how they are produced, and the imlustry mecessary to collect su wast a fuantity. They are cach alome the size of a romel hutmog, and the bhe, which are the best, are entire, heine suthered before the escap of the insect. The smeallen white galls are of at gallowish-hrown colnme, and earl is perforated with a small romel hend, alnat the sixteenth of an ind in diameter, whene the insect has escapen. These gatls are prombed lyy a spuins of eynips (r. querens-metli) on the dyer's wak ("ucrous infecturio), a native of

Isia Minur, from the Busphoms to Syla, imel from the Grecian Ardhiplago to the frontiers of Persia. Ui this kind of gall, several varieties are known in conmuree, as the Alepmen palls; the Syrian or Dusul gathe, whintare the hat known; the Tripuli Tamplas on 'amabous galls, oltained from Comstantin"ple ; and the smyran pill.
$\because$ The small Alylu or mimiter wath, which is
 always perforated on mity galls, aml aro of a lirewnish-velluw colomr, zamil, aml with small bhant fines. The quatity usel in this comatry is mot vay limge.
3. The large hassurala, linswath, or Nucca galls, Which are the larges galls linown in comnere ; hey are as large as in Grleans phum, smooth, execper a ring of cumens slighty raised exeresences sometimes fome romel the midelde, dividine the gall into two hemindures. They are medish hrown, and are salin, when on the trees ( ${ }^{\text {and }}$, colnumed as lorightly as aples. These are the apples of somom. or the Dead sea apples, bright to the eyr, but fillel with a gritty astringent matter, which is likened to ashes; it is formed on the rencrevs iufectorin lig (ypmips insenta. These are not extensimely impurted.

1. The acom gall, Knopern, Knobben, Ifungatian, or German sall. 'This is fomed chicfly in Thungary, and is much nowl by the German dyers; it is also oceasionally nse! in the country, It is a chrions irregular-shafool brawn gall, deeply furrowed, and eovered with angular excresceners. It is
 ley ('ynips Qurime coly's.
2. The small Eist Indian galls called Dahme and Sumbut-ool-tomfa, are ohtained from the falim Tamarisk (Tamerid: Imlion). They are verg small, ahout the size amb colnur of tares, null are so remed and irseular in form, that they look rather like little lomps of dricel garden-soil.
3. The Chinese cratls, or Hin-pei-taze. These rery curins vectahle exeresences were regarded only as ariosities ten sears sine be, lout they now fom regular artites of commene. They are of a very irragular shape, manhing out sometimes like fingors. Their length selhom exceds two iaches; the'y are rarely nore than a quarter of an ineh in haneter at the lase, where they spuing from the trec, but they spead ont as monch sometimes as an inch and a half to two inches. When broken, they are found to consist of a thin shell, not thicker than a wannt-shell of a dank-y lowish or redelish-hrown enlom intemally, and semi-transpuent; hat externally they are covered with very line down, and conserguently look like the pomig horns of a stag when just thading. They are produed on the likus semi-atake (see Sumben), hy an insect not ret known to science. Since the Japmese ports have been opened to British commerce, consiterable impurts of these curious galls have been received irm that country: They are rather more hranchal, the lamehes or lobes lieing smaller than in the Chese varicty, but in all wher respects they are incutical.

A very great many galls are known in most parts of the wold, and in our own comery the oaks yiche numerous species, lint those above enumerated are the galls of commerce: fow uthers have ever been frimd to pay the expense of collecting. Galls are axtensively uscel in dyeing, checly for the protuetion of lack coluurs, with logwod and the silts of irm, wither for dyang in the piece, or printing patterns; in cach case, the matcrial is first sulmitted to the aretion of a solution of the salls, and afterwarls to another of the dyewom and iron salt. They are also an important constituent in writing-ink (seo
[NK), ant are used in tanning the liner kimets of fancy leathers.

## GALVANISM.

GAbsism: lisk - When two plates of copper and amalstanhed fine (zine whose surfate has leen rubleal over with meretry) are placed in a ressel (ig. 1) wontaning water to which a small quantity of sulphuric acid has been added, so long as

Fig. 1.
they are kept from tonchiag, either within or withnut the lipuin. they remain apparently umaffected. lif, however, they be made to tomeli, hublales of hodrown wis are fomed in abmolance at the copper plate, and then fomation eontimes until the plates ar. acain separated. If the contacet le maintrinel fro some time, and the plates and liquin be afterwayls examined, it is found that the copper pate wouls exactly the sane as before, that the aine plate has lost in weight, and that the liqual contains the lost viue in sulntion in the form of the sulphate of that metal. The contact need not be aflocend by the plates thenuselves. If wires of coplur, os ary other conductor of coectricits. be soldered to the plates, or fixal to them hy hindiner serows aml he made to tomeh, the changes just mentionsel take phe as if the plates were in contact. When the wires are thus joinmal, and so to speak, form whe comaceting wime between the plates, they exhinit vers peouliar propertics. If a purtion of the emmection wine be phaced parallel to a magnetic nemble, and the neefle bromblat mear, its north end no bonger fuints to the morth, lout to a puint cither to the east on west of it, and this deviation cases with the splaration of the wires. It is nut "ren nevessary that the wires be in contact, for if the:r ewls he dut into a vessel containing a conductiny liguin, the same chages occur, though to a diminisheal extent. the contact beiner completed throngh the lipuin. The ands of the wires, when so immersed, show strong chomical affinities lf the eonlactiog liguid wert a solution of the sulphate of equer, the wire from the zun hecomes coated with the coprer of the solntion whilst the other attracts its oxyren ami suluhric acid, and wastes away in cutering into combination with them. The commetine wires we foumd, therefore, in actual "Ir virtnal combination, to possess wery marked marnetic ant whomical properties. The arranvement

 Purlin, consefion: and the boperties just reformel to, form the chanacteristic mowers of gatranic
electricity. These propertics arise from the wires in eommection lreing the seat of a constant discharge or thow uf electricity, fur they are possessed, though to a very feelle extent, by the electricity of the frietion clectric mathine. If the prime conductor of a powerful electrit machine (see Electiserrs) be eomnected with we of the binding screws of an insnlated galvanometer, and a wire commected with the ground be lixed into the other, the plate on bemer turned causes a current of electricity to pass from the machine to the grommel through the coil of the galvanometer, the nedle of which will then shew it deviation of one or two degrees. The deviation, so far as direction is concerned, is the same as that which would be proluced ly placing the wires cominur from the copper and ane respectively in the same binding screws as those conuected with the maehine and the grommd. This wouk indieate that the eopper plate stands electrically in the same relation to the zioc phate as the prime conductor of the machine to the gromml. The electricity of the conductor is positive, and that of the ground by induc. tion neqative: so that in the galvanie pair the copper plate, by analogy, sives oll positive eleetricity, and the zine plate negative. Agaiu, let the wire from the machine cad in an insulated vessel containing a solution of the sulphate of copper, amplat the end of a tine platinm wire connected with the ground be made to dip below the surface of the solution, and let the machine be kept in action so as to send a current of clactricity throngl the wires and liguid, at the end of some mimntes the point of the platimum wire will be covered with a minute guantity of copper. The wire commected with the zine in the galvanic pair and that connected with the gromed, are thas shewn to display the same chemical power; and this, ayain, shews us that the zine plate, like the cromel in the above experiment, is the seat of negative electricity. The electric condition of the pilates before eontact reveals, with the aid of the condenser, the presence of prositive electricity in the conpur plate and aurative in the zine plate. If the wire joined to the zine plate, $w$ as we may write it shortly, zine wire (not, however, necessarily a zine wirc), be connected with the groumd, and the insulated colpor wire he made to touel the lower plate of a conilonser whilst the finger tonches the upper, mi looth heing withdrawn, the leaves of the electroscope diverge with the jositive electricity sent to it from the copler plate. It can le shevn, moreoror, that the current is not confined to the connecting wire, for if a maguctie needle he suspended hetwern the plates wheo they lie north and south, shinhtly above the smface of the liquid, it will deviate from its usual position when the wires are joincel, and in the opposite way to that which it shews when held above the wire placed in the same direction. The enrrent thes passes within the liquid from the zinc to the copper the olposite way tu that in which it runs in the comnecting wires, so that it makes a complete cirenit. Hence we may conelude, sencrally, that in the meleane pair a current of electricity runs within the lisuid from the chemically avine to the chemicully paswire jhate, and without the liguill, from the chenicully prssite to the chemicully artive plate, making a conmplupe cirenit; and that if the connection be interrnped the pair shews electric pularity, the chemically puswive phate beine the positive polt, unel the chemically uctive plate the neyative role.

The theory of the action of the galvanie pair may be thas given. When the two pilates are put intu the water and sulphurie actel, they assume Mrusite electriestates. There is developed at the smifues of the zine an electric force arising from its aflinity fur the oxygen of the water, which throws

## GALVASISM.

the whole arrangement into a state of polarity. This is roughly shewn in tig. O. The zinc plate with its wire becomes polarised, shewind negative clectricity at the extremity furthest from the

lig. 5
liguid, and positive electricity at the extremity next the lifuid. The eopper plate with its wire is polarisel in the opposite way heing positive at its outer end. and negative at its end mext the limail. The compound molecules of water. (HO), emsisist ing of oxygen ( 0 ) and hydrogen ( H ), are likewise polarised, but the polarisation takes place in the indivilual molecules. It appears, morenter, to have reference to their compond nature, and we may imagine them placel in serics such as the one in the figure. with their axyren or aegntive pole toward the zine, and their hydroten or maitive pole toward the copper. The positive farts are thistinguished from the nerative parts in the figure by being shamed. When the emels of the wires are hrought near each othor, we might anticipate in these circumstances that a spark lischarge, as with frictivnal electrieity, wonld restore quibsence. This, however, is not the case, for the dectrie tension is so low that mothing short of contact can effect a discharge. When the diseharge thms takes place, the polarity of the circuit fan the instant eeases; the tendency to umion of the zine with the atom of nxygen next it is completel liy the formatimu of the nxide of zinc. But in order to aceomplish this, the hydromen of the molcente of water next the zine thus set fre unites with the oxygen of the neighbouring molecule to ro-form water, ami the same transferenee and mion is continnct along the whole series natil the hyilrosen of the moleculd next the enpper is thrown on the erpper, where. being unable to unite ehemieally with it. it assumes its natural gaseous state. In this way the chemical action, althugh only manifested at the plates, is not confined in them, hut takes plaee thronchout the liquil between all the contivuous molecules giving passage to the current. The oxile of zime Firmed on the zine plate is instantly dissolved by the sulphurie acid present in the wator, leasing the plate as elean as before. After the first discharge, therefore, the whole arrangement resmmes its lirst condition, so that a sceond purisation ainh dincharge instantly follows, which is succeeded by a thirid, and so on. An uninterrupted serics of discharges is thus transmitter along the completer circuit, comstituting what is termal a current of electricity.
Father of the Galvanic Circuit.-In a wire where a current of galvanic or frietional electricity is passing, there is no point which forms the seat of positive or negative electricity; but it appars electrically homogeneous throughout. It exerts no
statical inductive action on surrounding objects, mither attration nor repulline them, for the clectric action bemg more asily propagated aloms the wire than in iny other elneetion, takes place only in it. The laws of imbation and dratribution appliahly to frictimal statual electricity hold true in current electricity only at the section of the wire or combetor alons which the action
 there is 1 wh part of the circuit wheh pussesses more power than another. This lomonenety anes rise to the hyputhesis, that erery muleculo it the circuit, whether soliel or liguid, acts in the transmission of the electric furce, and is similarly aflected in its pasaze. In this way the phates and comeeting wires shew the same inolecthar pularity as the ligual, only the discharere does wot thect an interchange amone the molecules, hat hoses them in the sume condition
ats before. Each molecule of the connecting wire may be viuwet, als in fig. B, to he the seat of clectrie $\mathrm{I}^{\text {mlarity }}$ and Mischarge

with its negative
faces turnell towards the copper, and its positive towards the zinc: whenever, therefore, we gn with the current, we meet each moleculs. wita nerative sile, and whenever we contrary to the enrent, we ment each molecule tom its prisitive side. Any fortion of the circuit such as that representel in the figure, shews its nomative fate to the approaching current, and its 1 wisive face at the other extrmits: A break in the connecting wire thus separates two eontimons molecules: that embing the copper wire shews itself positive ame that emling the zinc wire newative. Tlis is in prefect keeping with experiment, for wherer a break on change of medimm is male in the cirenit without stoppine the current-as in the electrie light, chemical chemmositions, the visibhe passage of dectricity in rachons tubes, and the like-the chels or poles exhilit upposite powors, from the pole mecting the currnt dischargine neative and the other positive dectricity. Thu pularity disHayed at such interruptions, or visild prassaces of the curront, is necessarily differnt from the pharity of frictional clectricity, fur the dymamial manifestation of eluctric force camnt be the same as the statical: in the same way that mortion, for instance, the dymanical manifestation of the fore of gravity is essentially ditferent from weight, its statical manifestation. Within the enalvanic par itself the same pharity is shewn the zine llate, without the lipuid or the wire connected with it, is found to act as a negative pule, and the similar coppre plate and wire as a positive pole: but within the liquid of the cell, the zine plate shews the same chomical atinities as the exterion positive fole and the similar onjer plate arts as the extcmon merative pole. The torns frsitive and negritive phes are merely relative, for every molecule or sories of molecules wound thas apiear to has its nlusite pules. They serve, however, conveniontly to eximes the relations of two eonsective barts of the cireuit. Consinferable confusion sontimes arises from speaking of the zine flate as at one the fusitive clemunt and negative pole, and the comer the newative clement and pusitive fole of the gramic pair, and such expressims suem eren ineonsistent. The truth is, that the aine and ennuer flates must have each both poles from the very hature of the cirenit; but as the onter poles ouly of these phates are uf
 puld.

 trm. Aumating ta the two-thand theory, twa such eurrents, whe oi the gnstive the ather of

Ilence it alpears, that evori in the tontary experiment of the contact themry, where it in suppesed that contact alome can buve nuy explamation, chemical actiom, arisus from the swoat of the hingers ant wxytu of the air atheng on tha zine, is present. Firmay's expermental researches seem to place boyond dispate the truth of the chemical theors. We shall here quote two of his many beantiful expromments illustrative of the sulject, which aro of themsedres quite convincime Let (ligg 4) $I$ and

B lo two ghas vossels containing sulphuret of potas. simn. 'Two platinum plates, 1 ' and $\mathrm{F}^{\prime}$, are put into the vesse $A$, mal an iron plate $F$, with a platioum Wate 1" in b. "'o the flatimm plate 1 " a platinum wire $p$, and to the irom plate $F$ an iron wire $f$, are attached. From $]^{\prime}$ and $P^{\prime \prime}$, wires proceed to the galvimometer $\mathrm{f}_{\mathrm{A}}$. The sulphuret of putassimm is. for a liguib, a woul eomductur of electribity, hat is chemically mactive when associated with platinum and imn in a cirenit. When the wios $p$ aml $f$ are juined, if an clectro-motive fure were developed at their surface of contact, all the comblitions necessary for a circoit luing present, a ebront whald lie gennated, which womlid deflect the needle of the gremanomer. This last, howiver, gives not the slichtest uidence of a currat. If zinc loe interposed at the junction of $\%$ and $f$, the palvanometer is cqually matiocted; lat if a jorece of piluer moistened with sulphurie acid lue phearl butween the ends of these wires, a decindet lethetion ensues, int the iron bermos the positive clement of a photinum-iron bair. We have thus ernelusive evidence, that the simple contact of the iron and the platimum is mattemal hy colectro-motive foree, and that this is
 of an interpesed liquid. Again, into che of the vossels just refurma to. let two plates, one of copper, the wither of silvor, he placed, and let commmanation he estahlished butween them and the manameter. The neerlle at first reflects briskly in a direction which shews that the comper is the positive element
of the pair, it then madually returns $t_{0}$, its lirst position, and aqain deflects in the opposito direction; shewing that the silver is now the positive ellomont. After smo time it returns, and again deflects in the original divertion, and wes on thas changing. If the phates le examined chang these changes, it is observed that sulphuret of coplutr is formed when the corren is pusitive, and sulphuret of silser whan the silver is pusitive; the alternate action being attributalde the relative condition of the phates whon coated with their sulpharets. 'Ihn Hoctro motive fomer of a sitser copler pair is thms shewn to le not insariable in direction as the contact theorists mantain; but to wange its direction with the se:at of armical antion.
 have lithort, supposel that. in the yalvianic pair, the sine alome hat atlinity for the nxymen of the water, Dut chemistry touches $u$ o that conpry likewise Jas the same athinity. thomgh to a loss alogree Hane we must emelnd that there ariginates at the conpre an chectronotive force acting contrary to that of the riace and that the Alertro-motive force of the prid is the rittione of thes "pmaing forees. Wire we to take two similar pates of anc instate of one of zine, and the rother of copper, we shmale thas lave two erpal forecs tentmer to prom two "qual emrents in "phnste directions. In this case the two forers would eduilitrate calh other, ame electrical and chemical inaction womb be the consequence, a comelnsion quite in keeping with experiment. It therefore becomers meessary th comple the zine with a motal such as eopher, less oxidable than itself. lakemping with this theory; it is fomed that if the rine le compleal with a metal less widable still than colper, the resnltant electromotive force is increasel. A pair consistine of zinn. and silver gives an chertribity of higher tensiom, and consequatly a more fow orful current than ove of zinc thel copper, and one of zinc and plationm a stronger current still: silver leming less oxidable than copper, an platimm less than siluer. As zine forms the principal clement of experse in maintainins the corrent, a platiman-rinc pair is more "conomical than either of the wher two just namest, bevause, for the same guantity of zine ilissolvel, it gives the best deetrical result. The freater, then, the disparity in rexdabilits, of in liability to be ablecten by the excitimer liguin of the metals of the pair, the greater is its f"smer.

In the galvance cell we have fomed that mot mly the metals, but likewise the clements of the liguid, act as if they asmmed "IJusite electrieitics. "Tlue rine is poitive with vicrence to the coprer, and the lydrogenstands in the same redation to the wxyen. In the 'Electro-chemical arder of the blements, (1). V) the wements are aproximately araned acercling to the part they womld Ihay if associaterl in a malmit: frir, Inginimis with potassimm, the most alectro- prsitive :minding with axsen, the most electronegative: ach hoing pasition to the one succreding, amb neative to the ond preding it. Chemically speakins chetromative has much the same meaning as oxitable. We may here repeat the more common doments in the same orter: Potassium, sulima, macrasim, zine, iron, leat, conner, silver, platimm, hydrogen, caimm, whorine, sulphur. "xpere. If it were proposes to ascertain from this list the action of a datinum-iron pair immersed in a solution of hyalrochloric acill (He'l). we should proced to argue thos: Iron, proceding phatimm, is pusitive in rulation to it. (hhorine succeeds hyirogen, imul is relatively megative.

Icemding to Punsen, the new metal, caesimn, is the most clectro-posilive substance yet known.

 Tropurtioment th the numb, e ot colls, supposing of comres, that they are arramed consecotively in in the Highe Hime the electrivity of a mitery is 1, ther alde t. foree its way throwh impertect ernhbeturs than that of the simple pairs. When the monfular commmication is formed ly at thick
shurt wire, a single cell prohnces as powerinl an aflict on the maguetio meenle as a lattery ; lat of
 amb thin wire, or a liguid, the ethent is very diff rent. Tho charent of the par is then nearly stimped, and its inthence on the meedle small. whike that of the battery continues to thow enmparatively mimpaired. lat the presence of considerable resistance, the guamtity if electricity transmitidel, or, as it is temend, the shergth of the current, danmels mot only on the size of the plates of pache comple, but alsin in the number of comples. That the whectric tension should multiply with the number of cells, may le accomet for ly the comsideration, that insteaid of one pularising force, there are several, all action in the same direction, each one exalting the polarity of the moleenles probluced liy the ther.

Ififarent Forms of the Gituruic Buttery-IFolta's pile is shewn in fige (b. It eonsists of a mumber of circular plates, each made up of a plate of copper ami a plate of rime sollered together, built up, the copper plates facing one way, and the zine the other. whe compound phate bein: separated by a cirenlar piece of woollen cloth. moistered with at sohution of cummon salt, or dilute sulphuric acid. Jn ennsequence of the great numlar of pairs, the electric temsion of the proles of Volta's pile is considerable. One furnisbed with from 60 to 100 plates can charge an electroseope withent the combensins plates. It is from this battery that the $f$ crm pibe' is appleil to the ralvanie or voltaie hattery. Volta used another fom of hatters, whicla be called a crouth vit cuis. This consisted

Fig. 6. uf a number of cells like thase in five 1. arranged in a circle, so that the first and last were continuous.

Zemboniè $I$ Fiy Pile consists oí several lnuadreds, and sumetimes thonsands, of dises of paper timed on me site. and covered with binoxitle of manyanese on the other, put torether consecutively, as in Voltats pile, and placed under pressure in an insulating eshass tube clused with brass ends, whiels serve as the poles. The dectric tension of the poles of this arrangement is considerable, hut the strength of the current whiel passes when the poles are joined, is next to nothing. The most mpurtant application of the dry pile is in the construction of a very delicate electrometer, which is named after its inventor, Bohnenberger's electrometer.

The Gulvanic Trough, introlnced by Cruikshank,

Fig. i .
is a trough (fig. 7) into which rectangular plates of copper and zinc, bike those of Volta's pile, are tixed,

## GALVANISM.

the cells included between wach pair being filled with dilute sulphurie acill. The inner surface of the trongh is coated with an insulating snbstance.

Wollaston's Eattery.-Each couple of this lattery (fig. S) is made up of a phate of compre, dombed up sin as to include a plate of zine, from
 which it is kept apart by strips of wool. Buth faces of the zine are thas equally expesed to chemical and sal. vanic action, a device ly which the quantity of electricity is increasel. Fis 9 shews a battery of five of these. The connceting strips of metal wre fixed to a woolen rinl, which alluws of them leing liftel or loweral tugether. When the battery is put in aution, the whole is lowered, and the five couples are immersed in tive troughs tillal with dilute sulphurie Fise aciot (l) of the acil to le of water) When out of action, the whole is lifted and fixed hy hinding serews to the two suphorting pilhas. When the number of phirs is small, as in

Fig. U.
the figure, it is of little consequence whether one darce trough or tive small ones he used.

Smep's Luthery.-ln smee's couple, the position of the flates of Willaston's eonple is reversed. It emsists of a silver flate, with a zine phate on either sidn, kopit separated from it hy slipis of wool, the two zine plates being fastened by a compling. There are thus twe jositive phates to one negative. insteal of two nogative to one lositive, as in W゙nliaston's couple, and this is found to incrense still more the strength of the eurent produced. The silver phate is phatinised-that is, cesered over with tidely divided platinum-ame this is foum to lessen the athesim of the hydromen mables to the pate, thereley greatly improving the constancy of the actim. Fmen's hattery hais the same arring (ment as Wrollastun's.
Grore's Gus Battery. This battery is more intendet fin instruction than use. One of its eells is shewn in dig. 10. Into the two outer necks of a threeneckel linttle, two glass tubes are fitted ly means of corks through which they pase. Eich of these tube is olpen below, and a platimum wire enters thom hermetically aluwe, to which a long strip of platimum is solderet. extemline nearly to the lotem of the tube. Little cups containing mercury stanl at the pplyer ents of these wires. The whole apparatus is tilled with slightly arbl water, ant the poles of a matranic lattery are placed in the little enps. Water is therely decomposel: axygen forms in the one tole and hydrogen in the other. When the battery wires
are removel, no change takes place till metallie commetion is estahlished between the cups, and the oxyten aml hydrogen gradually disalymar, atteuded ly an clectrie enrrent which lassers from the axyen to the hylrogeu. Whiniseveral of these are put tane ther in a battery, the connection ]remg always exyen to hytrogen, they eat itecompuse water. The must im. purtant fact illustrated by Cirove's hattery in, that the uxyen and hydrogen, liber. ated ly salvanc ageney, whea lefto themselves pro. luec a curnent the "In"sit. tu that which sepuraterl. them. When the pules if the dreompersing hattery were in the noremy ennis. hylursen is civen off at tho nequtive ame oxyen at the fusitime pule: and as opqusite eleectricities attract. it is mamifest that the hydrogers in this action in position and the oxyen monatio. When the two fars form, ley means of the platinum platers, a galwame patir ley thomshlves, the current must jrnced. as in all ame : from the fusitio to the negative withon the limul, and the reverse way letwen the julde; lint this is the "plosite of the direction of the orimal current. it is therefore manifest that whem oxyen on havregen is est iree at any peint in a palvanic cirenit, they will teme to send a connterement. This ution is callont trabonic potorivetion. This aceomes for the suduth falling ont in streneth in all galvanie couple where hydrogen is set tree at the negative phate. The loblube of the was athering to the plate, ant inly lessum the surfaci of contact betwen the plate and the limind, loit wort an electromotive force contrary to that of the 3 mir, and this ynes on inereasing until the action lemones upently reduced. In all inprased forms of the pair. it therefore heomes necessary to alngt som means fur proventing the disencasment of hatrumen at the nesentive plate, and this is Jome in all romotent buttorite hy cmploying twon dinids instead of one. The host known constant latteries are those of Daniell, Cimwe, and Lunsen.

 moreury, be phed wor it, the combined gases rise inth. the tube, and the quantity of the grem eff in "tions time mecsures the strength of the curront. The whameter chouses ats at thet the work which the curnent can actually perform, and establishes a buform standard of comparison. The indicutans of the tangent gatramometer are comparable onty with its own, lint the phantity of ans discharzed her the voltander, correctenl for prensure and tem-
 lye conphrine the indications of both instrumenta wht whe other when flaced in the sime circuit, ath abshote standad may likewise lee got for the tansont sulyameter. If, for instance, the current gival ly a hattery should rive 2 enhid inches in : minnte, as show by the voltancter, and produced at the same time a iletlection of 4.5 in the sampanancter, the ratio of 2 to the tansant of $40^{-2}-$ viz. 2 to $\mathbf{1}=2$, is comstant, for correct measurements of the streneth of currents, howere taken. must hear twewh wther it bonstant ratio. If the angle of deviation for amothe emerent was 30 , we have therefore only to multidy 2 in the tanrent of 30 , to ascer. tain the ammant of gas that would be liberated by a courent of that strencth in a mimete. This fomal, We know the maning of a dethection of $30^{\circ}$ of the galsammeter in question in a perfectly comparable standaral. The phates of the viltancter must be ramall, for when they are later, a small gmantity of adectricity is fum to pass whont recmansing the water, it is fund also, that a mimate guantity of the wyen fomas limmide of lydrosen with the water, amb remains in sulution, sin that when wry
 to he measurcl.
 the dimensions and material of substances inchuded in the cirenit exereise on impurtant inthence on the strength of the curront. It is af the gratest impertance tu asertain the redative amount of the resistance offered hy conductors of varions forms and materiads. The oftowitel, invented by Wheatstome, is semerally employed for this furpose, and for this iliject is constructed so as to introduce M withtraw a considerable amount of liuhly resisting wire trm the circuit without stopping the curront. It is shewn in fir. 응․ Two 'rlinders, (". (', athint 6 inchus in leneth, and l! buch in diametor. are placed paradlal to eath other, luith
 beine movalle romat their axis. One of them, $\mathrm{C}^{\prime}$, is of heass, the other, ' , is of well-drien wood. The woulde cylinder has a siral gronse cut into it, making forty turns to the inch, in which is fluent a the mactallie wire. One cond of the wire is fixell the brass ring. which is seen in the finare it the forther end of the wooden eytinder: anl its othor end is attachonl to the neirer end (mit sen in the fionre) of the hass cylinder, $C^{\prime \prime}$. THe brass rine just mentioned is connected with the limine screw, s, be a strong metal spring. 'The further end of the evtinter 0 ', has a similar

## GALVANISM.

connection with the binding serew, S'. The key, H , fits the projecting staple of cither cylimier, and can consequcatly turn both. As the hass cylinler, $\mathrm{C}^{\prime}$, is tumel in the same direction as the hands of a watch, it nncoils the wire from the woriden cytinder, C, making it thereby rewolve in the same way. When the wooden cylimer is turnitl contrary to the bauds of a watch, the reverse takes place. 'lhe number of revolutions is shewn ly a scale phaced between the two and the fraction of it revolution is shewn by it pinter muving on the gradnated circle, I'. When the hinding serews, stanls', are inchuded within a circuit, say $\therefore$ with the pusitive, and $s$ with the me gative fold the current passes along the wire, on the woond "glinder, $C$ ", till it comes to the point where the wire mosses to the brass cylinder, $0^{\prime \prime}$; it then passu* up the cylimber, $e^{\prime \prime}$, to the spring and himine screw, $s$. The resistance it encounters within the rhoostat is mot only in wire, for as soon as it raches the larg"ylinder, (", the resistance it encmuters up $t=S^{\prime}$ may he considered as nothing. When the rhenstat is th be used, the whole of the wire is womat on ther woolen eylinder, $\mathbb{C}$, the linuling serews are put into the circuit of a constant cell or battery alans with :t gibvammeter, astatic or tamgent. If, now, the resistances of two wires are to lee testerl, the gealvanmet $r$ is read before the dirst is put in the circuit. After it is introduced, in ernserfunce of the increasel resistance offered by it, the neelle falls back, and then as much of the rlacostat wire is unwome as will bring the ueedle lack to its furmer place. The quantity of wire thus mucuiled in the rheostat is shewn by the scales, an! is manifestly ecgual in resisting power to the introndecel wire. The dirst is then removed, the rheostat realjusted, and the secoml wire included, and the same unwinding gocs un as before. Th, fix our ibluas, let the quantity of wire wwound in the first case he 40 inches, and in the second case fol inches; 40 inches of the rheostat wire offer as math resistame. to the current as the first wire, amb 60 inchos of it ats much as the secoml. We have thens 40 to (0) as the ratio of the resistances of the two wires. The wire of the rhenstat, from its limited length, ean only be comparable with small resistances; ann where ereat resistances are to be measured, supplementary rasistetmen coils of wires, whose resistances have been ascertained, are introduced intor tho circuit, or remoret from it, as vecasion reguires, leavine 4, the rhenstat to cive, as it were, ompy the iractional readings. This being premised, it will he casily umberstom how the following renults hate been ascertainel. It is provel, for instances that the revistonces at aties of the seme mutriat: and of uniform thickivss, are in the dirct meter of their lomythes and in the incern rotio of the nelectrs of the ir diameters. Thus a wire of a certan loncth offers $t$ wiee the resistance of its half, thrice of its thim, and so forth. Again, wites of the same notal, whose diameters stand in the ratio of $1,2, \therefore$ sir., offer resistances which stimd to each other is 1. 1, 1, de. ; therefore, the longer the wire the reater the resistance; the thicker the wire the las tha resistance. The same loblds true of liquils, but not with the same exactness. For this reason, the lurger the $p^{\text {lhates of a }}$ galuanic pair. and the marer they are flacel to cach other, the less will be the resistance affired to the current by the intervenims lipuil. The following table, constructed by Eil. Beequerel, gives the shacific rasistences of sime of the more common substaces, or the resistance which a wire of them, so to speat, of the same dimensions, offers at the temperature $0 t^{\circ} F_{\text {: }}$ ( Copmer, 1; siver, $!$; gold, 14 ; zine, 37 ; tin, 60 ; iron, 75 ; lead, 11 ; phatinum, $11 \cdot 3$; mercury (at $5 \%$ ), $50 \%$. For liquids,
the resistances are enormons as eompared with the metals. With copper at $32^{\circ}$ l. as 1 , the following liguils stand thus: Saturaterl solution of the sulphate of enper, at $45^{2} 16,16,5-5.5010$;
 sulphato of zine, $15,861,267$; sulphuric acid, diluted

 The slightest admixture of a forcign metal alters the resistanee very lecidedly: $\frac{1}{6}$ per cent of iron in edner wire increases the resistince more than 25 fre cent. It has leen fumd also that the resistance offered by a wire increases ats it o temperature risw. It is almust nedless to ahla, that the maducting powers of metals are inversely ats their pucitic ronstances, the least resisting icing the best combucting.
ohme's Lau:- -This law is singularly in arcortance with experimental results. It assumers that the 1- lectromotive forec for a particular galvanic pair is constant, and that the strength of the curpent it pronluces is tha guntient which resultes from hividing it ley the resistance of the circuit. 'Chis resistance anise's from two sonves, the first bung the resist.
 the secmen the interpelar resistance. If o represent the enectrometive force; $l$, the resistance within the eell ; $"$, the interplar resistance: and s. the stregoth of the current, or the quantity of electricity aetually tramaiterl, the statement of the law for -un couple stamls thus: $S=\frac{"}{l-u}$. The applicatim of the law in a few particular cases will best ilhustrate its meaniug. If we incrase the number of cells to $n$ we increase the dectromostive iorce $n$ times, and at the same time we increase the lipuid resistance $u$ times, for the eurent las $n$ tinnes as much of it to travel, then $s=\frac{n}{n}+m$. If in b small compared with $n$-that is, if the external cmace tion be made lya slort thick wire-it may be neglecterl, and so $S=\frac{n!}{n!}=\frac{b}{l}$. This shows that one coll gives in these circuanstances as promina a curcent as a large battery: but if on lue small with respect to $u^{-a s}$ in the interphar circuit of an Wectric telecrath battery-nh may be molected, and $n=\frac{m e}{w}$. Here we learn that the enrey of the corrent incrases directly as the number of cells. We may learn from the same that the intrulaction of the coil of long thin wire of a ralvanometer into such a circuit. introlucing but a comparatively small increase of resistance, canses a very slight dinimation of the eurrent streneth. li, acain. w. increase the size of the plates of a galvanie pair $n$ times, the section of the lipuil is proporthonately increased, so that whilst the clectromotive force remans the same, the cell resistane
diminishes $n$ times; therefore $s=\frac{e}{\frac{l}{n}+u,}$ or $S=\frac{m}{l+m w}$. If the exterior resistance is small, $n d$ may lo meglected, and $S=\frac{n d}{l}$, and the strength is thus shewn tu increase $n$ times. These are buly a very iew of the conclusious arrival at ly this haw. With the ain of a tangent galvanmeter, which gives the value of $S$ expressel in cubic inches of voltameter gas, we can easily ascertain the value uf e ambl for any pair. By making two olservations with two wires of known resistmee separately inchuded in the circuit, we have two simplo

Stetrophetas.-This is the art of watin: th. hasem metals with silver by the galyane cmando. It is one theoratically of geat simplicity, hat monnes in the sucessful aphication of it wey consmerahbe experience and skill. Articles that are chectrophed are gencrally mand of bows, honze, coplur, or wick silver. The lewt metro. phated guals are of nicked silver. When Iritami:1 metal, irom. ainc, or leal are electrophaten, they mant le first electra-comerem, as silvis dues mit adhere to the hare surfaces of these metals. (ireat care is taken in chanins the artiches previns to detrophating, for any surface impurity womld spoil the suevess of the "nration. 'They are first boiked in "anstic potash, to remove any adhering grase; they are then immersed in dhate nitrie ach, to dissolve any rust or uxide that may he formed on the surface : and they are lastly sconared with the sami. Lefore lane put into the silvering hath, they are washed with nitmate of mercury, which leaves a thin tilm of mereury on them, which acts as a coment hetwecn the article and the silver. The hath where the meetro-plating takes place is a large trough of earthenware or other non-condacting sulstance it contains a weak solution of cyanide If silver in eganide of potassium. A plate of silver foms the fusition "lectrole: and the articles to 14. Dhaten. home be pieces of wire to a metal rod lying acress the troush, montitute the negative decormbe. Whan the plate is commected with the copre ar peritive $f^{\text {mbe }}$ of a one or more celled Halman hattery atcording to the strength required, and the rom is juined with the rins or nemative Puld, whatal hammosition immediately ansues in the hath, the silver of the cranide hergins to dequsit itself on the shapmend objects, and the eramenn, liberaten at the phate, insobses it, de-formine the ryande of siver. According therr, as the sohution is weakened the thes of the 1 utal toning tor fom the enectronating it is strearthmal hy the eymide. of silver formen at the phate. The thickiess of the phate depemts on the time of its immersion. The electric emrent thas acts as the earrier of the metal of the plate to the whjects inmersed. In this way silue heomes furectly phastie in onr hamls. IVic can ley this means, withont mechanical exertion or the arat of the workman, convert a phece of silver of any shape, howerer irreghar, into a unifinm $)^{\text {late. which covers, lont in no way lefaces, }}$ ongects of the most complicated and chelicate forma. When the phateil objects are taken from the hath, they appear dull ant white: the dulness is first removed bi a smad ciredar honsh of brass wire driven ly a lathe, and the final $\mathrm{l}^{\text {edish }}$ is given ly hamishing. The process of elcetro-gidelug is almost inlentical with that of electro-plating. success in wither is attainel by proper attention th the strength of the hatery, the streneth of the shlution, the temperature, and the size of the jusitive electrode.
© A'LVESTON, a rity and seapmrt of the state of 'Texas, North America, is situated on the northast extremity of falveston islimh at the opening of the bay if the same name into the Ginlf of Nexico: lat. $29^{2} 10^{\prime}$ K., lons. $94^{\circ} 20 \mathrm{~W}$. It is the largest and most commercial city of Texas. Its harmur, the hest in the state, has 12 feet of water wer the bar at low tide. Its streets are strairht, spacius, amb clecant: and its principal buildangs

schools of varions linds. Here nearly all the foreign trade of the state is transacted. In 1858 , 61 forcign vessels, of 26,373 tons, entered and cleared thes jout; but the greater proportion of the trade is along the coast. In 19.36, the nomber of entraners of enasting-sessels was 30.04 , lob. beine steamers. regular lines of which ply from this town to New York and New Urleans, as well as to the south-west towns of Texas. The prineipal trale is in shipping eotton, of which from 300,0100 to $f(0), 0(t)$ bales were expmortial in lsis. The town has gond wharfs, several shiphtwinting yards, foundries machine-shops, cotton-presses, de. Pomlation rstimatel in 1850 at 4175 ; in 15.7. at 10.0100 . The liay of Galveston extends northwar. from the city to the month of Trinity liver. a distance of
 The island of Galyeston is a lenge strip , of lowlying gronnd with a mean elevation of from 3 to 4 fect above sealeval, and is about os miles ling, and from $1 \frac{1}{5}$ to 24 miles hrow. It was, from 1817 to 152 , the banat of the notorims pirate latitte, wha was disholged in the lattery year, and his settlement hruken up.
(iA'LWAY, a muncial and parliamentary borough of Irelanl, as seaport, and county of itsolif, stands at the mouth of the river Corrib, on the nurth shome of (abway Bay, 50 miles north-northwest from Limorick, and lam miles west-smuth-west from loublin. It is built on 1 with sides of the river. and on two islands in its chammel, its parts being united ly two lrinkes. It is conncetel with Lonch Corrib by a canal. and forms the terminus of the Mbllane ireat Whatorn liailway. A lime of steamers has, with a few intermptions, run for the last fomr years between (i, amo the Nouth American colonies, seven days hemp comsidered the usual time for a far passage. The old town of 1 : is poorly built anl irregular, and some of its oher lionses have a somewhat Nomish apperance, which is accounted for by the fommercal intervurse which at one time subeisted hetween (: and span. To one of these houses, which is marked wath a skull and erossbones, a very romarkable story is attached, of a mayor of $\operatorname{fi}$., James Lynch Fitzstephen, who, in 1493, Like lerutus of ohl, amblemned his own son to death for murder. and in order to prevent his being resened, actually cansed him to be hanged from his own wimbw. J'he new tum consists of well-phamed and speims strects, and is bnitt on a rismextmand, which slopes gradually towarel the sea and the river. Tho suburbs are mainly collections of wrothed calins, inhabited by a miscrably poor Mass of perphe. One of these sumaros, calleal chaddach, is inhahited by tishermen, who exchade all strangers from their suciety, and mary within thair won circle. Thes, tishermen still speak the lmah lancuas, and the lrish costume is still worn hy the women. They ammadly cect a 'mayor,' whose function it is to administer the haws of their fishery, and to superintend all intermal rembations. ©ne of the principal buidings of $a$. is the parish church of St Nicholas, founded in $1: 30$. in combection with wheh is an ecelesiastical boly called the lioyal conlege of Galway, consisting of a warden and cight viears choral, who are elected by the l'rotestant members of the corquation. In the Roman Catholic Church a similar ecelesiastical arragement formerly existed. The see of Enachdune, of which (: formed a part, was united to that of Tuam in 132. : lut in 1484, C . was constituted a warienship, with a distinct jurisdietion, similar to that of an episcopal see. The wardenship, in later times, was lheld by one of the bishops of the neighbouring sees. The right of electing the warden, however, was vested in certain

Catholic clans or families of the town-Blakes, boukins, Lyzoches, Frenches, de-who, by a curions lecal chstom ware distributed into 13 tribes. This siugular system, almost without example in the Catholic Church, contimen in use until abont 30 years ago; when, in 18:31, the warlmahip of C. was erected into an equeopal see the bishop of which is appointed by the sam" rulos which regulate other lepisenpal apmintments in Irelaml. Amme the uther editioes are three monasteries and live mameries; the gown's collece, promed in 1St9: Emamus smith's C'ulloge with an endowerd income of tiod a year; the county comrthonse; barracks, \&e. (i, has mumerous thom aml other mills, also breweries, distilleries, fommbries, de., extensive samon and sea tishing. a poed harbom, with doeks that anmit vessels of 500 toms, and a liehthonse. The exports consist mainly of corn, thur, baem, tish, kelp, and marbhe In 1s61, : itig vessels, of $9,0,25$ tons, entered and clearen the prit. G. roturns two members to parliament. Pon. (15GH) of town. 16,786 ; of parl. b., 24.!930; which shews a drerease, since 15.51 , of 7001 in the former, and of thetr in the latter. (1571-pop. of t. 1:, 1-4.)

1i. Was taken loy Hichard de Bmph in 1232 and the ancestors of many of the leading fatmilies now resident in this quarter settled here about that time. from the lith till the midde of the 17 th e., 6 . continued tor rise in eommercial importaner. During the latter purt of the 17th e., it suffered considerahly for its allowence to the royalist canse. In 1652 , it was taken by Nir Charles Coote after a bluchate of several months; and in Inly ] G9, it Was cumpelled to surender to (reneml Gibkell.

GilLWiAl, a maritime county of Ireland, foms the southern portion of the jrovinee of comanght, and is second in sizn of all the Irish comnties, Cork being the largest. It is bounded on the li. liy two marigable rivers, the Shanon, and its athuent tho Suck; and on the W. Wy the Athantic Ocean. It has an area of labit,3yt acres, of which the oum half is arable, and almost the whole of the remainder
 The county of $(t$. is watered in the east ly the Shannon, the suck, and thoir feeders; and in the west hy Loughs Mask and Corril, and ly the streams-nnme af them of any great improtancewhich fall into the longhs and into (Galway Bay. In the most sonthern portion of the connty are the Slieve-Baughtio Monntains; and in the wost are the well-known Twelve l'ins, a strikine momation group, with a qenera! hotht of akont guon fat: and the Man-Turk monntains, of ahout an cual height. This wostern furtion of the romety is execedingly wid and romantic; the halls are separated by picturesque plens, and by secluded and beatifil Haghes Sontlawest from Langh Corrib to the sea is the district called connemara, which contains vast buse mons, lakes, and morasses, am! presents a peculiarly bleak and dreary aspert. Sorth-east of Commenara is Joyeces Country, and south-east of it is lar-Comanght, or Western Comanght. The coast-line is stated to $\mathrm{l}_{1}$. about 400 miles in length, and the share is much lroken, and is irmged with momerous ixlands. On the coasts of Cunemara ('un-me-mar, lays of the ser") and l:or-Connausht, there are more harhours for vessels of large size than on any equal extent of coast I Phaps in Europe. The climate is mith and humid, and in low-lying localities, is som times unhealthy. The richest soil oceurs in the district between the hoad of Galway bay and the shannon. Agriculture and lishing are the mest general pursuits; kelp is largely manufactured; also wrollens, limens, friezes, felt liats, are manufactured. The lakes and loughs, as well ats the coasts of G., are well stocked with tish. The

## Gandolvo. See Castel-Gandolfo.

GANGA, or SAND-GROUSE (Ptcrocles), a gemes of gallinacenus birls, of the family Tetramidrr, closely allied to sronse and pitamigin, but listinguishilly a printed tail. The toes are not featherel. The speries are natives chielly of the warm parts of Asia and of Africa, and are most ahundant in arid samly plains. Two species, the Banded Sand-grouse ( $P$. arometrias) and the Pin-tailed Sand-grouse ( $P$. stemius), are foum in the sonth of Earope. The latter species is very abundant on the arid plains of Persia. In Euroje, it is found as far north as the sonth of France, chicfly in the sterite Lamber. It is always to be seen in the markets of Matrith. The Bandet Sanl-grouse is abundant on the vast steppe's of the sonth of linssin. The African slecies of this gemus are often to be seen in large flocks near phaves to which they resort to drmk.

GANGA SAGOR, a low swampy island at the mouth of the great western or holiest branch of the (ianres, particularly sacred in the cstimation of the llimins. Multitudes of f ilgrims ammally resort tir it, at the time of full nown, in Novmber and in Jinnary. Infanticide formerly took place to a vast extent at these festivals, but is now ${ }^{\text {ronhibited }}$ ly the Rritish gorernment.
G. Neiles, a river frominent alike in the religion and in the generaphy of the East, divides, at least towarils the sea, Iudia in its largest sense inter the two grand diviens of Mither and Further. Its entire length is more than 1500 miles. Its gencral direetion during the first half of its course is south-east: it then ilows east throurh the plain of bengel, as far as hajmuhal, a distance of almat 400 miles, after which it again procects in a smatheastern direction, and enters the sea through a multitndinons delta. For the $]^{\text {monoses of detiled }}$ description, the stream, which exhilits such is Ereat saricty of phass's in the different parts of its comso may be convenintly lroken down into tive sections: (1) from its springs to Gangetri ; (2) from Biamatri to Ilurlwar; (B) from Inwhwar to Allahabat; (1) irom Allahabad to Sechange, or the
heal of the Delta; (in) from Seebenage, or the heald of the Delta, to the bay of Bengal.
liont its spmings to Gongotri. - The Bhageretten. lhamathi, or Bhaghireti, womerally regarded as the true G., rises in Gurhwal, near lat. $3054^{\prime} \mathrm{N}$., amd lones. $79^{\circ} 7^{\prime} \mathrm{E}$, from a snow fieh imberded betwen thre monntains of ahnont 22?000 feet in hojolit. The actual spot from which it is secon to issue is itself 13,500 fere athore ther seat After a course of ten miles, throushont which the torrent is all but inacessible, it raches the temple of (tancontri. the tirst work of man on its hanks, at an elevation of 10.30 f feet, so as to have descomed
 eote. After a run uf seren miles, the stremm is jainel on the rinht ly the Jahmuri, considerably larger than itsin, in lat. : $: 1^{\circ}-2$ N. and lons. -. $3^{\circ}$ at E ; and the united waters 13 mile's further down, bust throng the Himalay Proper, in lat. $30^{\circ} 59^{\prime}$ N., amd lons. $25^{\circ}$ ES, Still 90 mike lower, it receives the Anknuma with a volume one half greater than its own. and hore it finst receives the mane dionges. A distaner of ${ }^{7} 7$ miles more carrin's the still rapit current down to Humbar, on the vorge of the great plain of llindustan, at an cleration of 1024 foct. shewine a descent of 0296 fuet in 157 miles, or of nearly 60 feet in a mile.-From II urducar to Allaheluth.-'This portion of the river, masaring 458 miles, and averaging a fall of 92 inches in a mile, is beset alonest throughout ley shoals and rapids. It is navialle, however, for river-craft the whole way tu Hurdwar, for passenger-steamers to within IOO miles of the monntains, ant for loated larges up to Campore, which is 140 miles above Allahabad. This last-mentioned city stanls at the conflucnce of the (9. and the Jumna.-Frem Allahatud to Seetymag, or the head tef the Detta.-This, the longest of the five divisions of the stream, measures 563 miles in length, and has a fall of alout five inches in a mile. Notwithstamting many shoals, it is practiealide throughont, cren in the driest season of the year, for vessels drawing fully 18 inches. Ahout 270 miles below Allahahai, the $G$. is joined on the left by the Glogra, having presiously received the Gumti on the same sile, and the Tons and the Kurmmassa on the right. About half-way between Allanabad and the Ghogra is the city of Denarcs. Between the Ghogra and Sedgunge, the prineipal alluents are the Sone on the right, and the Guabluk and the Coosy or Sun liusi, on the left. Along this tatire section, the (t. varies largely both in lirealth and in depth, acemuling to the season of the year and the state of tho water. From siceldung, or the hothd of the Delta. to the Bay of Bengal.-Here the dessent, along a lime of 253 miles, averages about thre inches in a mile. Thitherto swollen ly its feeldre, the (i. now legins to send off loranclics, farting at Seelognge with the Ehagrutti, and next, 70 milis further down, with the Jellinghi, at the town of the same name, which, after soparate courses of about $1 \geqslant 0$ miles each, unite to form the llowgy of cialentta. Below the 1 wint of departure of Thi Jellimghi, it throws mut similar offects, the Darabhanga, the Gorae, the ©hundni, and the Kirtynassa. Momwhile, this waste towards the right is in a great measure eompensated by athuents on the hit, more especially ly warions channels of the limhmaputra-the twa great net-works of waters intertwining themselves together in a manner too complex for delineation, and at last indenting a long line of const with at laint e0 estnarics. The mouth if the Thogly, the most availahle of all the lranches of the $G$. as the mans of conmmicating with the outside world, is in lat. $21^{\circ} 40^{\prime}$ N., and long. $s s^{\circ} \mathrm{E}$. By it the largest

## GANGES.

ships reach Diamond Harbow, while vessels of considerable hurden ascenit to Chandernagore. Between the Joogly and the G., alowe the Welta, there are two rmutes. When the water is high, the Bhagrutti and the Jellinghi afforl the regmisite facilities: hat in the dry seasom, the interomurse is mantained hy the Sundertumd or sunderhans Passage. a circuitous course to the north-enst, which upens into the ("Lunilni.

As a whole, however, the ( b , is incaghbe of heing definitely described. It varies not merely from Seasm tu seasm, but alsa from year ta year. From year to year it exchanges olil massages for new ones, more partionlarly in the allasial hasin of its lower sections. Wran as far "l ats Futtehome, immaliately abure Allaham, this characteristie is remarkathly exemplifent. The riwe has in this part a beil of the average with of fone miln within the limits of which it chanses its comrse ammally, in the lapse of fonr or five years shifting from the on limit to the other. Between season and seasom, again, the fluctuations are still mune conspicmons. 'lo take Lenares as an instance, the strean randes, acerrling to the time of the year, from 140 feet to 3090 deet in brealth, and frum isis foet to is feet in depth. Lower down, the vicissitnes, without bing more striking in themadres, monluce mare striking resuits. About the clase of July it considerahho propution of the Belta forms an inmation of more than (06) mides in (hametre, presentime nothing to the eye hat villages and trees, amd craft of every sort. Tor prevent or mitigate this evil. expensive dams have heen constructed, having collectively a lensth of above 1000 miles. The intluence of the tilles extembs, at the dry season, a distance of 240 miles fron the sea. The minimm quantity of water delivered per socmol has loen estimated at $: 6,5330$ eubic feet, and the maximum at 494,208 cubic foet. Like all livers that overthow their banks, the G. holds in snspension a large atmixture of muk and sand-foreign clements eminently unfarourable to steam-navigation, as causing quick wear and decay of the coclis and valves of the engines. It has been compmed that it lefivers. on an arerase, ammally into the sea $534,600,000$ toms of solid inatter.

Amonest the rivers which at the chosiend and the Poterinic period of India were held in juentiar sanctity by the nation, the (:-m, as it is called, the (fingit (ieminine)-undobledy ocenped the foremorst rank. In the velle portre, it is lut Seldim mationnd; and whever its inme ocenes, whether in the hatmis of the Riguede or the
 mythical marration is commeted with it. Jor dows the l:w-law of Mam jnstify the conclusion that its antlom was aepuaintent with any of the mytha which connect this river in the epric ferms and in the Puranas with the liantheon of Tadian. 'The carliest, amb loy far the most poctical lemend of the (B., occurs in that masterpince of samserit functry, the Ramamen. Wir give its sulstance, beeanse it explains the principal anthets le which this river is spoken of, or involed. in ancient and modern
 as the tyre of the many falped whide refer to the purifyor and superatural pormertion of its waters. There lived, saty the himibona, in Ayodhya (the monern (hatw) a linge by the name of Sagara, who had two wives, Kesini amed sumati ; but they hore him no issur. He therefore repared to the Himalaya ; and after a hmmlred years' severe austeritses, bhrisn, the saint. became favourable to his wishes, and granted him posterity: Kesini bore him a son, who was namell Asamanjas, aur Sumati brought forth as gourd, whence suraus

canymedes, the curbearer of Zens, was, according to Homer, the soll of Tros, or, according to others, of Lamednu. Hus, or Erichthonins. The most beautiful of mortals, he attracted the notice of the king of the genls, who respatchen his eagle to cary him ofit to heaven, where he succeeded II be in the oftice abure reiervel to. The Greeks helieved that $Z$ ells gave Tros a pair of divine horses as a compuastion for kidnalying his luy, and comforted him at the same time ly informing him that ( 6 . had become immortal and free from all earthly ills. At a later perion, 6 . was identifiod with the divinity whe presided over the sulures of the Nile. The Grobls astrommers likewise placel him among the stars, under the name of Apuarius (the water-bearer), in allusion to his celestial imaction. He was also :a favourite subject of ancieat art.
f.aOL. Se Prison.

GAOL DELITERY, COMMLSION of, is one of the four commissions issued to judges of assize in Englind, under which they discharge their duties on circuit. Sec Assize. Commission of gaol delivery empowers the julges to try and deliver every pisoner who shall be in the gand when they arrive at the circuit town. It is directed to the judges, with whom are conpled the serjeants-at-law and Queen's counsel on the circuit. the elerk of assize, and the assuciate. It constitutes the persons to whom it is directed the Queen's justices, and orders four. three, or two of them, of whom me must be a julge or serjeant, to proceed to try prisoncrs. It was inciently the comrse to issue precial writs of gat delivery for each maticular prisomer, which were eallad the writs te bomo it mulo: luat these laint found inconvenient and onpersive a general commission for all the prisoners has long been established in their steal (Stephen, (omm. iv. 37l). It is not ine umbent on the commissuners to deliver all the prismers in the gan, lut they cannot try any one who was not in custory or on bail at the arening of the commission. A commission of gaol delivery has prwer to order that the procedings at any trial shall not be pmblished till all the trials are timished. Vinlation of this order is contempt of mart, and is pumishalle by fine ame imprisomment. At common law, a commission of gal delivery is surfonled by the Court of Quen"s Bench sitting in the same comnty; but ly $2 ;$ dico. III. e. 18, the sexsinm at Newgate of oyer and termiuce and gaol delivery is not tole interripted by the commencement
of term and sittiner of the Kiners Bench at Westminster. liy 4 and of Will. If: ©. 36 , a special comirt has lwa createrl for London am the suburbs, called the Central Crimimal Court (f. w.), for which a special commission of ginl delivery is issucal.

CAI', a small town of Framed, capital of the dipartment of llantes Aljes, is jlabintly situated on the right hank of the Laio. ahout in milens senthcast of Gremoble. It is appoacheal throuph walnut ayenues, and surromderl ly shopes on which the vine flomisles at the leight of a-nis font above seateval. Whan seen from a certain distance, the town has a picturespure appearinco'; lont on a closer inspection, it is foum to he morely a latyrinth of dirty, narrow, and ill-pavel streots. The chief puldic Muldine is the eathedral, with a mansoloum m marble of the Cimstalde de feerlicuitres. The town has manuactures of cosmse wathers, linems,

'th, the anciont litpincum, was formerly capital of the district of !amphine, to which it gave the mame of lapmoois. GAにIDADDJ, Gitesmef, was lom at Nioe, odl Fhly 140 , wi wectable parents. His father, the twher uf a tranting vessel. having been endeaged all his life in maritime pursuits fount $(:$. smon acmuired a struns predilection for the hazards of a seafarine life. With the permisam of his father, he whyted the professim of a sailor, and made his lirst vigate to lhlessa under the command of an alin and isperienced seaman, Cuptain Pesante. He subamuently risited Rome, Cagliari, Badu, Cichoa, de, with virious commameles, and sonn lecanse a skilful amb fearless mariner, "istingmished ly his bronpt decision in action and imperturbable pre sence of mind. In $\mathrm{J} 8 \mathrm{~S}_{\mathrm{O}}$, he was himsedi in command of the hrie. So're Dame te Firice: and about this tinn lis sentiments of patriotism seem to have ganesl increased intensity, owing to his interennse with a Eervil ltalian patriot, a casual passenuec on Jumblhe vesocl. From ls33, his acpuaintance with Mazzini and the leadets of the Italian liberal movemont dates, and form that period his mumenchable hatreal of hespotism, and devotion to the service of noniversal frembon, exercised a prodominant inthe ence on alt his actions, ame nitimately heanme the simpter motivo of his carece In JS:34, havine connpromiset hinnself hey participatine in a fatile revo. lutionsury onthreak at fenoa, he was compelled to sume lig life ly fiyht ; and after exteme harelap, succecherl in fainise French territury simultanne nusly with the fulblication in Italy of the sentenee of his monlmmation to leadh. it. now resumed his safarixe life, abl after some unimportant vopuge sailod fur Sontla America. When liosas, the chotator of Bumens Ayres, leclared war arainst
 thy latter, :mil somisave prouf uf su whankabla a thlent for mihary lealership, that he was mased to then Fumen" rommand looth of naval and military "中": tans. In 1848, war having broken ont between Anotian and the liherals of Italy, (i. hastomed tu

Furnor. He bure an effective part in the whole of the Italian campaign, but especially distinguished himsolf at limne liy his resistance to the french firces, who during foum weeks were successinlly kept at bay, and repeatedly repulsed by the republiem Forees of Fiome, under the direction of taribaldi. lome having at lenuth succumbel to the immensely superin forces at the disposal of (icmeral ondinot, (i. marched forth from the city as tha leremely poured in. After a retreat of mparalleled difliculty through districts densely oecupied hy fustrian forees, (i., aceompanied by his stevoted and horoie drazilian wife, set sail in a small fishine-eraft towarnls Venice; but being pursned hy Austrian vessuls, they were compelled to lamd at random, and not far from the shore his wife, exhansted lis the dangers and terrible exertions of them dlight, expired in the arms of her husbani. (ir at length reached Genoa in safety, and from thence embarked for 'limis. Io afterwards revisited Sonth Ameriea, anl aequired the eommand of an American traling-vessel. In that capseity, he touchent at severinl limedish ports, where he was received with every testimony of public almiration and sympathy. During the interval which clapen between the war of 15 as and that of $\mathrm{T}, \mathrm{sin}$, C . mublicly acepter the substitution of monarely, suels as it existed in liedmont, for tho republican form of gorermment, for which he had briginally combated, and was therefore free to servo as in irregilar anxiliary of the Piedmontese fores on the ermmencement of hastilities. His services in that capacity were both brillint and effective, notwithstaulinis the limited seome assigned for his conerations. In the course of the following year (lbol). the most triumphant and momentous enterpite of his marvellms carees was accomplished. The chief result of the prace of Villafranca, by which the Italian war of IS.0 was brought to an abrupt and unsatisfactory termination, was tho immediate resumption by the ltalian people of the revolutionary and progressive responsibilities, which during the eampaign houl been vested hy the wation in the govermment of sardimia. 'I"lus, early in J860, insurrectionary disturbances broke out in Pulermo, and althongh speedily quelled in the city ly the reat munerical strength of the Neapolitan graris, $n$, they were constantly repeated thronghont the interior of the ishand, where the insurgents were full of elation and daring, in consequence of $G$. having transmitted to them the assurance that he would spedily appear himself to head their struggle. In fulfilment of this promise, $G$. assembled at Genon a volmateer force of 1070 patriots, and on the 5th of Mar set sail for the ishame of Nicily: On the Ilth, his two small transport steamers having rached Marsala in safety, the landing of his fallowers was successfully effected in sight, and partially under fire, of the Neapolitan fleet. On the listh, in the battle of Calatatimi, 3600 Neapolitan troops were routel by (i,'s small force, and to this opening victory may be largely attributed the subserpuent suecess of the cntire expedition. It at once cleared the way to Palcrmo, and inspired (i.'s suldiers with irresistible confidenee. On the lSth of the same month, $G$. and his little amy uf heroes occupied the heights which command lalermo, and after a desperate conflict with the poynlist troops, fought his way into that unhappy rits, which for several subsequent days had to sustain a ruthless bombardment from the united fire uf llue Neapolitan garrison and tleet.

Hhe intervention of the British Ileet, seconded by the isnlated and destitute combition of the garrison slut up in the forts, ins?uced the Neapolitan gencral to capitulate; and on his departure vith his troops, fi. remainel in undisputed possession of the city
and stronghends of l'alermos. His firat public enact ment was the universal amment of the eitizens, On the entla of laly, at the heal of exom men, la gave hattlu at Melazzo t" 7000 Nengulitame, whe were completely defeated, and compandel to cracuate the fortress. On the esth, the Nrapmitims were driven back intos Mcesina, whor 4 , mate his trimphal entry on the ?th, the matimens garrison, torvitial at his approach, havimer momellel the it semeral to sumbit. Towarls the mimhe of Amont. Pr, mate a deseent in (calabria, and was immeriately johnol by large bodies of volunters fome ail directions, ly whom he was acemapmien on his memorahle and evental march to スithes. Spanish colonies. Originally, it eonsisted in simply placing a cord rounl the neck of a criminal, who was seated on a chair fixed to a post, anll then twisting the corl liy means of a stich (whenee the name) inserted between it and the hack of the neck, till stramulation was produced. Afterwards, a brass collar was used, contaning a serew, which the exechatoner turned till its point contered the spinad marrow where it unites with the brain, cansing instantanous death. The inguisitors were wont to grant as a fayour this mole of strauglation, before being harned, to such combemed persins as recated. If the exentioner was makifful, however, the pain

 at Cnença, a ${ }^{\text {hoor }}$ Jew, who had ohtamel this dismal privilege of preliminary strangulation, nuticing the buagling manuer in which the exerutioner had performed the opration on the two who preceled him, said to the latter ; 'l'cter, if you are likely tu strangle me so clunsily, 1 wowl mach rather be burned ative.' The same process was also apthed as a species of torture to the limbs, or to such portions of the body as might he injured with comprarative inpmity. It is probalie that the Nimamers alloptel the garote from the Nloors; at all events, in its primitive form, it exaetly resembles the punishment of the bowstring in me among Mnhammedan uations.- (tarrotthes is also the name given in England anl seothand to a suecies of robhery which has reently become rather connmon, in which the roblers suddenly come behind their victim, and throwing a cond. or hadikerchicf, or something of the sort, rom his neek, prombe temprary straugulation till their $l^{\text {nurpuse }}$ is ethected.

garter. See Beat.
GARTER, Omer of the. The order of the garter was in tituted ly King Elwand 111., aut though not the most anciont, is one of the most famous of the military orters of Europe. Sulm says that it 'exceeds in majesty, honome, and fime all chivalrous "ralers in the woml.' It is said to have been devised for the purbose of attracting to the king's party such suldiens of fortune as might he likely to aid in asserting the claim which he was then making to the crown if Framo., and intendel as an imitations uf King Arthur's rombel table. The remond table was urectel at W'intor. ami the knights ami arilles who were invited foum all parts of the word were exercised at tilts and tournamemits as a preparation $\begin{gathered}\text { ge the } \\ \text { the }\end{gathered}$ magnificent feasts that were spread before them.
That general 'jousts and tournaments' of this deseription were hell at Wimbsor, is known from the letters summoning them learing date 1 st Janary list, aml quotel hy Sir llaris Niedas in his Urders of $k$ nuighthood, i. p. 6 : and from the narrative of Froissart, who comeets them with the institution of the order. The original number of the kinights of the garter wais twenty-fise. his majesty limself making the twenty-sixth. The story that
the Comotess of Salishury let fall her garter when danciug with the king, and that the king licken! it ul and tial it rombl his own leg: lont that, olserving the juatous ylamees of the gueen. he restored it to its fair won w wh the exclamation: Honi soit gui mel $y$ porne, is alont as well autlacnticaterl its must tales of the kinid, and has, moreover, in its fitwon that it acemmens for the uther. wise unacematable emblem ame motero of the ortar. Sir Harris Ninulas, whose emmo dexs mot nsmally lie in the divection of crela. lity, says, that thouch the writers on the ondre lave trated it with contrmpt, they havencither sucemend in shewing its absurd. ity, nor succrested a
